ABSTRACT

Background

Caries (dental decay) is a disease of the hard tissues of the teeth caused by an imbalance, over time, in the interactions between cariogenic bacteria in dental plaque and fermentable carbohydrates (mainly sugars). The use of fluoride toothpaste is the primary intervention for the prevention of caries.

Objectives

To determine the relative effectiveness of fluoride toothpastes of different concentrations in preventing dental caries in children and adolescents, and to examine the potentially modifying effects of baseline caries level and supervised toothbrushing.

Search methods

A search was undertaken on Cochrane Oral Health Group's Trials Register, CENTRAL, MEDLINE and several other databases. Reference lists of articles were also searched.

Date of the most recent searches: 8 June 2009.

Selection criteria

Randomised controlled trials and cluster-randomised controlled trials comparing fluoride toothpaste with placebo or fluoride toothpaste of a different concentration in children up to 16 years of age with a follow-up period of at least 1 year. The primary outcome was caries increment in the permanent or deciduous dentition as measured by the change in decayed, (missing), filled tooth surfaces (D(M)FS/ d(m)fs) from baseline.

Data collection and analysis

Inclusion of studies, data extraction and quality assessment were undertaken independently and in duplicate by two members of the review team. Disagreements were resolved by discussion and consensus or by a third party. The primary effect measure was the prevented fraction (PF), the caries increment of the control group minus the caries increment of the treatment group, expressed as a proportion

of the caries increment in the control group. Where it was appropriate to pool data, network meta-analysis, network meta-regression or meta-analysis models were used. Potential sources of heterogeneity were specified a priori and examined through random-effects metaregression analysis where appropriate.

Main results

75 studies were included, of which 71 studies comprising 79 trials contributed data to the network meta-analysis, network meta-regression or meta-analysis.

For the 66 studies (74 trials) that contributed to the network meta-analysis of D(M)FS in the mixed or permanent dentition, the caries preventive effect of fluoride toothpaste increased significantly with higher fluoride concentrations (D(M)FS PF compared to placebo was 23% (95% credible interval (CrI) 19% to 27%) for 1000/1055/1100/1250 parts per million (ppm) concentrations rising to 36% (95% CrI 27% to 44%) for toothpastes with a concentration of 2400/2500/2800 ppm), but concentrations of 440/500/550 ppm and below showed no statistically significant effect when compared to placebo. There is some evidence of a dose response relationship in that the PF increased as the fluoride concentration increased from the baseline although this was not always statistically significant. The effect of fluoride toothpaste also increased with baseline level of D(M)FS and supervised brushing, though this did not reach statistical significance. Six studies assessed the effects of fluoride concentrations on the deciduous dentition with equivocal results dependent upon the fluoride concentrations compared and the outcome measure. Compliance with treatment regimen and unwanted effects was assessed in only a minority of studies. When reported, no differential compliance was observed and unwanted effects such as soft tissue damage and tooth staining were minimal.

Authors' conclusions

This review confirms the benefits of using fluoride toothpaste in preventing caries in children and adolescents when compared to placebo, but only significantly for fluoride concentrations of 1000 ppm and above. The relative caries preventive effects of fluoride toothpastes of different concentrations increase with higher fluoride concentration. The decision of what fluoride levels to use for children under 6 years should be balanced with the risk of fluorosis.

PLAIN LANGUAGE SUMMARY

Comparison between different concentrations of fluoride toothpaste for preventing tooth decay in children and adolescents

Many children experience painful tooth decay which can lead to the tooth/teeth being extracted. Even if teeth are not extracted the tooth decay may be distressing, be expensive to treat and may involve children and their carers having time off school and work.

Another Cochrane review showed that fluoride toothpastes do reduce dental decay, by about 24% on average, when compared with a non-fluoride toothpaste. This review compares toothpastes with different amounts of fluoride.

This review includes 79 trials on 73,000 children. As expected the use of toothpaste containing more fluoride is generally associated with less decay. Toothpastes containing at least 1000 parts per million (ppm) fluoride are effective at preventing tooth decay in children, which supports the current international standard level recommended.

Although none of the trials included in the review looked at fluorosis or mottling of the children's teeth, fluorosis may be an unwanted result of using fluoride toothpaste in young children and a Cochrane review on this topic has also been published. The possible risk of fluorosis should be discussed with your dentist who may recommend using a toothpaste containing less than 1000 ppm fluoride.

BACKGROUND

Description of the condition

Tooth mineral is lost and gained in a continuous process of deand re-mineralization. Caries (dental decay) is a disease of the hard tissues of the teeth caused by an imbalance in this process over time, from the interactions between cariogenic bacteria in dental plaque

and fermentable carbohydrates (mainly sugars). Aside from the pain arising from the carious lesions themselves, there is also the emotional distress of the disease and the potential consequences of medical intervention. Affected teeth cannot always be saved and may have to be extracted. This has particular consequences for young children, for whom general anaesthesia may be required. There is an associated social impact of this disease in terms of absence from school for the children and absence from work for their carers. There are also important financial implications for this disease with a substantial proportion of healthcare budgets being spent every year on treating caries.

Whilst in some areas of the developed world there has been evidence of a reduction in the prevalence and severity of dental caries in recent years, social inequalities in dental health exist, with many individuals and communities having a clinically significant burden of preventable dental disease. Whilst some success has been achieved in a reduction in caries in adults, challenges remain in the prevention of caries in young children, and in reducing inequalities in this population.

The link between fluoride and oral health dates back to the 1930s. Nearly 80 years on and fluoride remains one of dentistry's key strategies for the prevention of dental caries. At the 8th World Congress on Preventive Dentistry (Liverpool, 2005) members of the International Association for Dental Research, the World Health Organization (WHO), the European Association of Dental Public Health and the British Association for the Study of Community Dentistry put forward a call for action in the 'Liverpool Declaration' (IADR/WHO/BASCD 2005). They outlined nine areas of work that should be addressed by the year 2020, one of which was the need for countries to ensure the availability of appropriate and affordable fluoride programmes for the prevention of tooth decay. This has recently been reinforced by the findings of a Global Consultation on Oral Health through Fluoride (2006) which suggests that promoting dental health by using fluoride will "improve quality of life and enhance achievement of the Millennium Development Goals by reducing the high dental disease burden of populations, especially children in disadvantaged populations" (FDI World Dental Federation 2006).

Description of the intervention

There are many methods of fluoride delivery e.g. fluoridated water, milk, toothpaste, gels, varnish etc. The beneficial effects of topical fluoride agents have been examined in a series of high quality Cochrane systematic reviews (Marinho 2002; Marinho 2003; Marinho 2003; Marinho b 2003; Marinho b 2003; Marinho 2004; Marinho a 2004). In particular, evidence for the use of fluoride toothpastes is unequivocal (Marinho b 2003). Summarising all available placebo-controlled evidence from randomised controlled trials (RCTs), the review concluded that fluoride toothpastes are effective in preventing caries when compared to nonfluoride toothpastes in children and adolescents and that the effect of fluoride toothpaste on caries prevention increased according to some factors, which included higher fluoride concentration. However, comparisons of toothpastes of differing fluoride concentration were not explicitly (directly) evaluated. This review aims to evaluate the relative caries preventive effects of toothpastes of different fluoride concentrations with a view to establishing the benefits of different concentrations for children and adolescents. This review has been conducted alongside a Cochrane review evaluating the effect of topical fluoride (including that from toothpaste of different concentrations) on dental fluorosis (Wong 2010). To be fully informed of the potential caries preventive benefits of fluoride toothpastes of different concentrations and the potential risks of fluorosis arising from fluoride toothpaste use both reviews should be read.

Why it is important to do this review

The objectives of the WHO Global Oral Health Programme are detailed in a WHO report (Petersen 2003) and summarised in a global policy document (Petersen 2009) with one of the priority action areas being the effective use of fluoride. Prevention and effective use of fluoride toothpaste is the recommended strategy for oral health in children and adolescents in a recent Lancet editorial (Lancet 2009), although it is acknowledged that its cost prohibits its widespread use in many low-income and middle-income countries. It is important that recommendations concerning the use of fluoride toothpaste are evidence based. The recently published document 'Delivering Better Oral Health: An Evidence-Based Toolkit' from the Department of Health in the UK (DoH 2007) on fluoride concentration in toothpaste has cited evidence from the Cochrane systematic review (Marinho b 2003), a single RCT (Davies 2002) and three published reviews of fluoride toothpastes for caries prevention in children and adolescents (Ammari 2003; Steiner 2004; Twetman 2003). This toolkit recommends that for preventing caries in children aged up to 3 years "only a smear of toothpaste containing no less than 1000 ppm fluoride" be used, and for all children aged 3 to 6 years "a pea-sized amount of toothpaste containing 1350-1500 ppm fluoride" be used. For children older than 6 years, fluoridated toothpaste of 1350 ppm or above is recommended. The table of key references cited in the toolkit provides "further relevant references" pertaining to fluoride concentration:

• "Toothpastes containing 1450 ppm fluoride offers more caries-preventive effect than toothpaste containing 440 ppm fluoride" and

• "Toothpastes containing 1450 ppm fluoride offers more caries-preventive effect than toothpaste containing 1000 ppm fluoride."

Evidence to support the former recommendation is the Cochrane systematic review of placebo-controlled trials (Marinho b 2003) and a single long-term RCT based in deprived areas of the North

of England (Davies 2002). Whilst the Cochrane systematic review concluded that the effect of fluoride toothpaste on caries prevention increased according to higher fluoride concentration amongst other factors, this was not explicitly evaluated and no optimum level of fluoride concentration for caries prevention was given.

Evidence to support the second recommendation comes from meta-analyses in reviews carried out in 2003 and 2004 (Ammari 2003; Steiner 2004; Twetman 2003). The reviews differ in their methods, though none have been undertaken as Cochrane systematic reviews. Not all reviews have included an assessment of the quality of trials, and some of the included studies are cluster-randomised, with no evidence that this has been taken into account in the analysis. Many important details of the review research process go unreported in these publications. For instance, it is unclear whether a protocol was written prior to undertaking the review, and search criteria are not fully documented. Additionally, important information on methods of analysis of the concentrationresponse effectiveness has been omitted or has been undertaken sometimes narratively. The comparisons made in the reviews are:

• 250 ppm relative to 1000 ppm (n = 4 trials) (Steiner 2004);

• 250 ppm relative to 1000 ppm (n = 6 trials) and 500-550 ppm relative to 1000-1055 ppm (n = 2 trials narrative only) (Ammari 2003);

• fluoride toothpaste compared to placebo, <1000 ppm relative to 1000-1100 ppm (n = 4 trials), 1500 ppm relative to 1000-1100 ppm (n = 9 trials) (Twetman 2003).

A further published meta-analysis examined the caries preventive effect of higher level fluoride toothpastes of 1700 ppm, 2200 ppm, 2800 ppm relative to 1100 ppm (Bartizek 2001). This meta-analysis was based on a single multicentre randomised controlled trial. No Cochrane systematic review including trials of active interventions, i.e. fluoride toothpastes of different concentrations, and placebo-controlled trials has been undertaken.

Recently revised guidelines (EAPD 2009) from the European Academy of Paediatric Dentistry on the use of fluoride in children have provided recommendations which include fluoride concentration, frequency of daily toothbrushing and amount of toothpaste to be used, for children from the ages of 6 months through to 6 years and over. Whilst fluoride concentrations have been recommended for the different age groups, based on previous reviews (Steiner 2004; Twetman 2003) the authors of the guidelines state that "a children's toothpaste with a lower concentration of fluoride may be indicated although the evidence for a caries preventive effect of formulas with less than 500 ppm fluoride are insufficient." Further, in considering the potential caries preventive benefit of fluoridated toothpaste against the potential risks of fluorosis before the age of 6 years the authors state that "care must be taken to ensure that a balance is maintained between maximising the protective effect against dental caries and minimising the risk of dental fluorosis."

A systematic review addressing all the available evidence on the concentration of fluoride in toothpastes using appropriate statisti-

cal methodologies will identify the relative caries preventive effects of toothpastes of different fluoride concentrations in children and adolescents. Effects on the deciduous and mixed/permanent dentition will be assessed separately.

Traditional approaches to meta-analysis have focused on direct (head to head) pairwise comparisons within RCTs. However, when many different interventions exist, the number of pairwise comparisons becomes prohibitive and interpretation difficult. For example when there are six interventions to be compared, this will result in 15 distinct pairwise combinations. Combining similar fluoride levels may be a solution, but this runs the risk of obscuring subtle concentration-related differences in effect. Adjusted indirect comparisons can be made between trials with a common comparator. Further, with advances in statistical methodologies, it is possible to combine both direct and indirect evidence from RCTs in what the Cochrane Handbook for Systematic Reviews of Interventions refers to as multiple treatments meta-analysis (Higgins 2008). This methodology is sometimes known in the literature as network meta-analysis or mixed treatment comparisons (MTC). Such a technique refers to a meta-analysis of multiple interventions, and can involve both direct and indirect treatment comparisons. This has been used to evaluate many different interventions including for example self monitoring of diabetes (Jansen 2006) and stroke prevention treatments (Cooper 2006), and is suitable for both binary and continuous outcome measures. The research will therefore incorporate a substantial statistical and methodological component and will advance knowledge in this area. A systematic review addressing all the available evidence on the concentration of fluoride in toothpastes will help to identify the relative caries preventive effects of fluoride toothpastes of different concentrations. This is important as fluoride has been identified as a causative factor in objectionable enamel fluorosis in children. Other factors which may modify the influence of fluoride concentration on caries prevention will also be evaluated, based on previously published literature. Baseline caries level and whether toothbrushing is supervised or not have been identified as potential effect modifiers in a previous review (Marinho b 2003). Compliance with the intervention could also be proposed to influence any treatment effect. Possible differential effects on the deciduous and mixed or permanent dentition will be evaluated by undertaking separate analyses.

The primary aim of this review is to provide a clear and robust summary of the research evidence on the relative caries preventive effects of fluoride toothpastes of different concentrations for dental health in children and adolescents.

OBJECTIVES

To determine the relative effectiveness of placebo and fluoride toothpastes of different concentrations in preventing dental caries

in children and adolescents, and to examine the potentially modifying effects of baseline caries level and supervised toothbrushing.

METHODS

Criteria for considering studies for this review

Types of studies

Randomised controlled trials (RCTs) and cluster-randomised trials (CRCTs) comparing fluoride toothpaste with placebo or fluoride toothpaste of a different concentration with a follow-up period of at least 1 year. Studies where random allocation was not used or indicated were excluded, as were split-mouth studies.

Types of participants

Children and adolescents. Studies where the majority of participants were aged 16 years or less at the start of the study were included (irrespective of initial level of dental caries, background exposure to fluorides, dental treatment level, nationality, setting where the intervention is received or time when the intervention started). Studies where the participants were selected on the basis of special (general or oral) health conditions were excluded.

Types of interventions

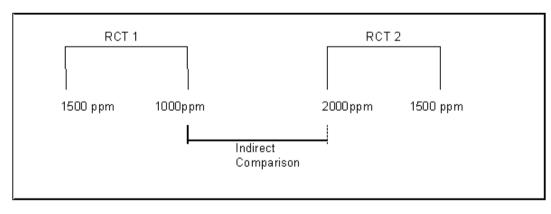

Studies making a comparison between at least two fluoride toothpastes of differing concentrations, or fluoride toothpaste and placebo toothpaste. Fluoride agents combined or not in the following formulations:

- Sodium fluoride (NaF)
- Sodium monofluorophosphate (SMFP)
- Stannous fluoride (SnF₂)
- Acidulated phosphate fluoride (APF)
- Amine fluoride (AmF).

These may be formulated with any compatible abrasive system and are considered at any fluoride concentration (parts per million (ppm)), frequency of use, amount or duration of application, and with any technique of toothbrushing or post-toothbrushing procedure. Studies where the intervention group alone or both the intervention and control groups received any additional active agent(s) or caries preventive measure(s) as part of the study (e.g. chlorhexidine agent, other fluoride-based procedures, oral hygiene procedures, sealants, xylitol chewing gums, glass ionomers) in addition to the fluoride or placebo toothpaste were excluded. Studies that included participants receiving additional measures as part of their routine oral care such as oral hygiene advice, supervised brushing, fissure sealants etc. were included.

It was acknowledged in advance that the comparison of certain fluoride toothpaste concentrations may be sparse, and direct and indirect comparisons were undertaken where appropriate (Figure 1).

Figure 1. Illustration of potential indirect comparison, using placebo toothpastes as common comparator, and fluoride toothpastes of 1000 ppm and 1500 ppm.

Types of outcome measures

Primary outcomes

The primary outcome measure is caries increment as measured by

either:

• change from baseline in the decayed, (missing) and filled surface (D(M)FS) index, in all permanent teeth erupted at the start and erupting over the course of the study (dental caries is defined here as being clinically and radiologically recorded at the dentine level of diagnosis);

• change from baseline in the decayed, (missing/extraction indicated), and filled surface d(e/m)fs index, in deciduous tooth surfaces;

• change in the proportion developing new caries.

Secondary outcomes

The secondary outcome will be side effects such as irritation, dental staining/discolouration etc.

Search methods for identification of studies

The searches attempted to identify all relevant studies irrespective of language until June 2009. We aimed to have all papers not published in English translated. There was no restriction with regard to status of publication and both published and unpublished studies were sought.

Electronic searches

The following databases were searched:

- Cochrane Oral Health Group's Trials Register (8 June 2009)
- Cochrane Central Register of Controlled Trials
- (CENTRAL) (The Cochrane Library 2009, Issue 2)
 - MEDLINE (OVID) (from 1950 to 8 June 2009)
 - EMBASE (OVID) (from 1980 to 8 June 2009).

Sensitive search strategies were developed using a combination of free text and controlled vocabulary. The strategy for MED-LINE (OVID) is presented in Appendix 1. This was run with the Cochrane Highly Sensitive Search Strategy (CHSSS) for identifying randomised trials in MEDLINE: sensitivity maximising version (2008 revision) as referenced in Chapter 6.4.11.1 and detailed in box 6.4.c of the *Cochrane Handbook for Systematic Reviews of Interventions* 5.0.1 (updated September 2008) (Higgins 2008).

Searching other resources

Reference searching

Previously published systematic reviews of fluoride toothpastes were also screened to identify any reports that met the inclusion criteria (Ammari 2003; Bartizek 2001; Clarkson 1993; Steiner 2004; Twetman 2003). The Cochrane fluoride toothpaste systematic review (Marinho b 2003) has recently been updated and relevant trials located through the update were incorporated into this review.

Searching for ongoing trials

The trial databases ClinicalTrials.gov (www.clinicaltrials.gov) and The *meta*Register of Controlled Trials (www.controlled-trials.com) were searched to identify any ongoing studies of relevance.

Data collection and analysis

Identification of studies

The downloaded set of records from each database were imported into the bibliographic software package EndNote. Duplicate records were identified and removed. All records were independently scanned for relevance by two of the review authors on the basis of title and abstract (where available). Irrelevant records were discarded and the full text of the remaining records was obtained for further evaluation. Relevancy was assessed according to the characteristics of the participants, nature of the intervention, comparison and outcome as stated in the review title.

Selection of studies

Following the initial screening, for studies appearing to meet the inclusion criteria, or for which there was insufficient information in the title and abstract to make a clear decision, the full report was obtained. These reports were assessed independently and in duplicate by the review authors to establish whether the studies met the inclusion criteria. Disagreements were resolved by discussion. Studies written in a language not known by the review team were translated by members of the Cochrane Oral Health Group and included/excluded as appropriate. Those studies awaiting translation are presented in the Studies awaiting classification section of the review.

Studies rejected at this or subsequent stages were recorded in the Characteristics of excluded studies section with the reason for exclusion.

Data extraction and management

Data extraction was undertaken for all studies meeting the inclusion criteria independently and in duplicate by four review authors (Helen Worthington (HW), Priscilla Appelbe (PA), Valeria Marinho (VM) and Tanya Walsh (TW)) using a piloted data extraction form. Information on study design, participants, intervention(s) and comparator, and outcomes were extracted, specifically:

• Article information: author, journal, year of publication

• Study information: location, duration of data collection (months), date of baseline collection^[1], dates of data collection, number of centres, location setting where participants were recruited (e.g. school), other sources of fluoride exposure^[2], duration of intervention, individual or cluster-randomisation

• Participant information: age at baseline, initial number, baseline caries^[3], mean decayed missing and filled surfaces/teeth (standard deviation (SD)/standard error (SE)) for deciduous or permanent dentition or both

• Intervention: concentration and formulation of fluoride, abrasive system, frequency of brushing, supervised brushing, duration of intervention

• Assessment: teeth included, criteria for clinical diagnosis, calculation of change/increment, diagnostic threshold, net or crude caries increment

• Outcome information: final caries and number, proportion of children developing new caries, mean DMFS/dmfs (SD/SE) increment, mean DMFT/dmft (SD/SE) increment, level of compliance

• Reliability of primary outcome measurement: number of examiners and calibration details, method of clinical assessment

• Side effects: e.g. soft tissue damage, dental stain, irritation.

^[1] When data on the study start were not provided a 'probable date' was calculated by subtracting the duration of the study (in years) plus 1 extra year, from the publication date of the study.

^[2] Background exposure to other fluoride sources encompassed data on the use (outside the trial) of topical fluorides/fluoride rinses or even fluoride toothpastes (in studies where the intervention was tested under supervision at school and no supply of any toothpaste had been provided for home use) and the consumption of fluoridated water/salt/tablets. Background use of other fluorides (rinses, gels, tablets, etc) should be clearly reported as used by the majority in a study to be considered as such, and exposure to water/salt fluoridation should be above 0.3 ppm fluoride.

^[3] From the study sample analysed (final sample) and in connection with the caries increment index chosen.

It is acknowledged that caries increment could be reported differently in different trials. To account for this the choice of primary outcome will follow the hierarchy presented in the Cochrane systematic review of placebo-controlled trials (Marinho b 2003):

• data on surface level will be chosen over data on tooth level

• DFS data will be chosen over DMFS data, and these will be chosen over DS or FS

• data for 'all surface types combined' will be chosen over data for 'specific types' only

• data for 'all erupted and erupting teeth combined' will be chosen over data for 'erupted' only, and these over data for 'erupting' only

 data from 'clinical and radiological examinations combined' will be chosen over data from 'clinical' only, and these over 'radiological' only

• data for dentinal/cavitated caries lesions will be chosen over data for enamel/non-cavitated lesions

• net caries increment data will be chosen over crude (observed) increment data

• follow-up nearest to 3 years (often the one at the end of the study period) will be chosen over all other lengths of follow-up, unless otherwise stated.

Assessment of risk of bias in included studies

All trials included in the review were assessed for risk of bias independently and in duplicate as part of the data extraction process, with reference to the *Cochrane Handbook for Systematic Reviews of Interventions* 5.0.1 (Higgins 2008). A specially designed and piloted form was used for this purpose. Included trials were assessed on the following:

- Adequate sequence generation: Yes, No, Unclear
- Allocation concealment: Yes, No, Unclear
- Blinding: Yes, No, Unclear
- Incomplete outcome data addressed: Yes, No, Unclear

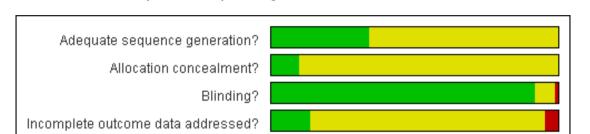

• Free of selective outcome reporting (e.g. DMFT or DMFS or both reported?): Yes, No, Unclear

- Free from baseline imbalance: Yes, No, Unclear
- Free of contamination/co-intervention: Yes, No, Unclear.

'Yes' indicates a low risk of bias, 'No' indicates high risk of bias and 'Unclear' indicates either lack of information or uncertainty over the potential for bias. A risk of bias table was completed for each included study (*see* Risk of bias in included studies and Characteristics of included studies). Results are presented graphically by study (Figure 2) and by domain over all studies (Figure 3).

Figure 2. Methodological quality summary: review authors' judgements about each methodological quality item for each included study.

<u>'n</u>%

Unclear

Figure 3. Methodological quality graph: review authors' judgments about each methodological quality item presented as percentages across all included studies.

Measures of treatment effect

The prevented fraction (PF) was the primary estimate of effect. The PF is expressed as the mean increment in the control group minus the mean increment in the intervention group divided by the mean increment in the control group i.e. the caries increment in the treatment group expressed as a percentage of the control group. The PF is considered to be more appropriate than the absolute mean difference or standardized mean difference as it allows for the combination of different ways in which caries increments are measured across studies and is simple to interpret. Variances and confidence intervals were estimated using the Stata user written program fielleri.ado (version 1.0 2004-12-07, Joseph Coveney), following the formula of Fieller (Abrams 1972). The PF was calculated at both a surface level and a tooth level, and deciduous and permanent dentition were analysed throughout.

Free of selective reporting?

Baseline characteristics balanced?

Free of contamination/co-intervention?

Yes (low risk of bias)

For completeness and to compare results with earlier publications, raw values (mean, standard deviation (SD), n) are presented along with the standardized mean difference (SMD) (Cohen's d).

For the proportion of children developing new caries, data were analysed using risk ratios (RR). Review Manager (RevMan) 5 was used for estimation of treatment effects using a fixed-effect model for the pooled estimate.

Dealing with missing data

For the main outcome data, missing standard deviations for caries increments not revealed through contact with the original researchers was imputed through linear regression of log (standard deviations) on log (mean caries) increments as per the Cochrane systematic review of placebo-controlled trials (Marinho b 2003).

Data synthesis

25%

50%

75%

No (high risk of bias)

100%

A graphical representation of the taxonomy of interventions to determine the nature of the network was undertaken. Estimates of treatment effects (PF and SMD) were calculated through the Stata software package. Network meta-analysis and meta-regression were carried out using the WinBugs package using a random-effects model for the multiple treatments meta-analysis for the prevented fraction data and standardized mean difference, taking into account the correlation between multi-arm trials where appropriate. This was undertaken at both a surface level and a tooth level, and deciduous and permanent dentition were analysed separately throughout. PF estimates of effect were calculated and entered into the WinBugs package using the contrast approach for trial level data to estimate direct and indirect effects. The network meta-analysis method enables the comparison of in-

direct effects, treatment comparisons not addressed within the primary trials. Such network analysis can only be applied to connected networks of trials (*see* Figure 4; Figure 5). The randomeffects network meta-analysis on which this analysis was based can be downloaded from www.bris.ac.uk/cobm/research/mpes/ mixed-treatment-comparisons.html.

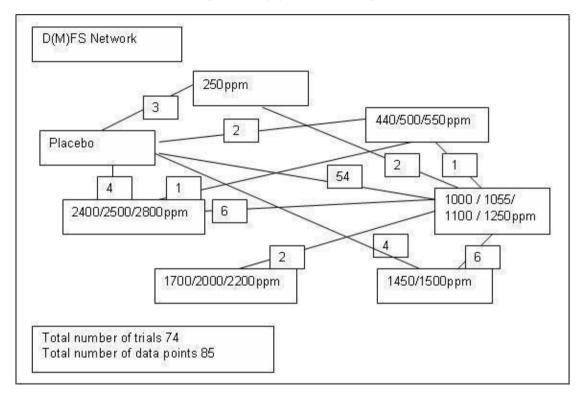

Figure 4. D(M)FS network diagram.

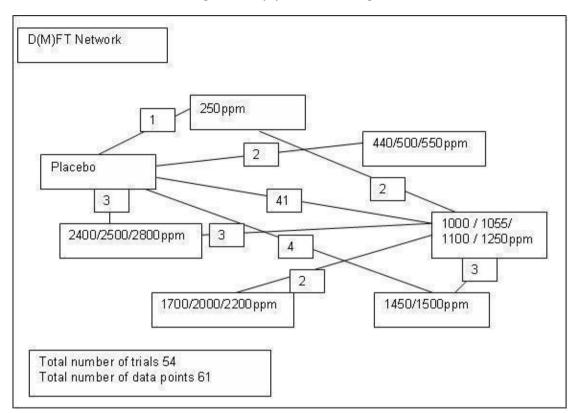

Figure 5. D(M)FT network diagram.

The goodness of fit of the models was assessed by calculating the residual deviance. This is defined as the difference between the deviance for the fitted model and the difference between the saturated model, where the deviance measures the fit of the model to the data points using the likelihood function. Under the null hypothesis that the model provides an adequate fit to the data, the mean residual deviance will approximately equal the number of unconstrained data points in the analysis.

For the proportion of participants developing new caries, data were analysed by calculating risk ratios. RevMan was used for estimation of overall treatment effects using a fixed-effect model for the pooled estimate. Studies reporting compliance with the treatment regimen or any side effects of toothpaste use were noted.

Subgroup analysis and investigation of heterogeneity

Heterogeneity was assessed by inspection of forest plots of the estimates and confidence intervals of treatment effects.

Two potential sources of heterogeneity were specified a priori: baseline caries level and toothbrushing (supervised or not), and were an important aspect of the review. To this end, a randomeffects network meta-regression was proposed where there were sufficient trials for this to be undertaken. Data from 'baseline caries level' were calculated from the study sample analysed and in accordance with the chosen caries increment index.

RESULTS

Description of studies

See: Characteristics of included studies; Characteristics of excluded studies.

Results of the search

Following the removal of duplicates, 1563 records were retrieved from the electronic database search. After applying the Cochrane RCT filter and removing duplicates, this number was reduced to 535.

The search for ongoing trials yielded no additional reports, as did the search of non-electronic resources.

Following screening, 129 records were considered to be potentially eligible, and sought for further detailed assessment. This resulted

in 75 included studies, 51 excluded studies and 3 reports awaiting assessment (either awaiting translation or insufficient information following translation to enable an inclusion/exclusion assessment to be made).

Included studies

See Characteristics of included studies table for details of included studies.

There are 75 studies included in the review, of which 35 have more than one publication. The following studies have been treated as independent sources as they contain more than one trial with either different age groups (Marthaler 1965; Marthaler 1970; Zacherl 1970) or report results separately from different locations (Forsman 1974; Held 1968) or both (Torell 1965). There are also distinct studies published in the same year by the same author (Slack 1967; Slack 1967a; Zacherl 1972; Zacherl 1972a). This results in 83 independent trials.

All reports were published between the years 1955 and 2008.

Trials were conducted mainly in the USA and UK, but also in the following locations: France, Lithuania, Germany, Italy, Australia, Sweden, Switzerland, Iceland, Denmark, China, Puerto Rico, Brazil and Canada.

Design and methods

The review includes both placebo-controlled trials and trials comparing one active intervention to at least one other active intervention. The review includes two, three, four and five arm trials. The minimum duration of the study for inclusion in the review was 12 months, and the longest reported follow-up period was 7 years. Analysis was undertaken on results nearest to 3 years followup.

One trial was cluster randomised (Sonju Clasen 1995) though reported as an individual randomised trial.

Participants

The minimum age of participants in studies of effects on the deciduous dentition was 12 months; the minimum age for the studies of effects on the mixed and permanent dentition was 5 years. Data on baseline caries level in the mixed and permanent dentition was reported in all but five trials (D(M)FS) and nine trials (D(M)FT) and ranged from 1.4 to 23.5 DMFS. For trials including participants with deciduous teeth, the maximum reported baseline dfs was 3.6 dfs.

Interventions

The review included 58 placebo-controlled studies and 17 studies making a comparison between active interventions. For the purposes of analysis, fluoride (F) concentration was grouped into the following categories and these numbers are used to designate the specific comparisons in the Additional tables:

- 1. Placebo 0 ppm F
- 2. 250 ppm F
- 3. 440/500/550 ppm F
- 4. 1000/1055/1100/1250 ppm F
- 5. 1450/1500 ppm F
- 6. 1700/2000/2200 ppm F
- 7. 2400/2500/2800 ppm F.

Interventions for the majority of trials specified unsupervised brushing.

Outcome measures

The primary outcome measure was caries increment measured at surface level, and this was included in all studies. Caries increment at tooth level, percentage caries free, proportion developing new caries were also measured. The majority of studies presented results for the permanent dentition; only five trials reported on caries levels in the deciduous dentition; two trials reporting d(m)fs and d(m)ft, one study reporting d(m)ft alone, one study reporting dfs alone and one study reporting caries progression and arrest. One trial reporting effects on the permanent dentition also assessed effects on the deciduous dentition. Adverse effects of the intervention were unreported in the majority of studies, but when reported included oral (soft tissue) damage and tooth staining. No trials reported on fluorosis.

Excluded studies

Reasons for exclusion of a trial from the review are given in the Characteristics of excluded studies table. The 51 studies were excluded for the following reasons: Non-random or systematic allocation, randomisation not stated or indicated, inappropriate randomisation (randomising two clusters, one to each of the groups compared), additional active agents or other fluoride-based interventions in addition to fluoride toothpaste or where participants were institutionalised children or adolescents with specific health problems. A trial could be excluded for more than one reason.

Risk of bias in included studies

Adequate sequence generation

Adequate sequence generation was observed in 28 trials (34%), where a clear statement of the method of randomisation was reported. In the remainder of trials a judgment of 'unclear' was given as reporting lacked description with such statements as 'were randomised' or 'were stratified' appearing most commonly.

Allocation

Adequate allocation concealment was observed in eight trials (10%). The remainder failed to indicate whether the generated randomisation sequence was concealed from individuals involved in the enrolment and assignment of participants.

Blinding

In 76 trials (92%), both participants and clinical examiners were blinded to the allocated intervention. There was high risk of bias for this domain in only one trial (1%), where the placebo and fluoride toothpastes were packaged differently and hence blinding of participants was not achieved.

Incomplete outcome data

In four trials (5%), attrition rates were unduly high given the length of follow-up e.g. over 50% in 3 years, over 40% in 2 years, over 30% in 1 year resulting in a judgment of high risk of bias. In 68 trials (81%) there was insufficient information to determine a judgment of high or low risk of bias. The principal reasons for judgments of 'unclear' on this domain were lack of reporting of this information or information reported but differential losses not assessable. The remainder of the trials fully reported on attrition rates by groups with reasons for attrition.

Selective reporting

73 trials (88%) were free of selective reporting in that all pre-specified outcomes caries indices were reported according to the different units measured, methods of examination, diagnostic thresholds for caries and approaches for reversals, with 10 (12%) trials providing insufficient information for a judgment of high or low risk of bias.

Other potential sources of bias

Baseline characteristics

Baseline characteristics were reported and comparable between groups in 71 (86%) of trials, with a high risk of bias through baseline imbalance of caries levels in the different fluoride groups for 4 (5%) trials. Baseline similarity was achieved through stratification by important prognostic variables. An unclear judgment was given for 8 (9%) trials when not reported or not reported by group.

Free of contamination or co-intervention

One study was judged to be at high risk of bias from contamination, when a concurrent fluoride rinse programme was introduced to trial participants. 59 trials (71%) were judged free from the possibility of any inadvertent application of the intervention being evaluated to people in the control group (contamination) and/or any additional treatment being given to one of the groups differentially (co-intervention), and hence were judged to be at low risk of bias. In 23 trials (28%) there was insufficient information to enable a judgment to be made.

Effects of interventions

Effect of fluoride toothpaste on dental caries increment

In accordance with the objectives of the review, and in line with the information given in the methods section, the results are reported separately for:

(1) Decayed, (Missing) and Filled Surfaces prevented fraction (D(M)FS PF)

(2) Decayed, (Missing) and Filled Teeth prevented fraction (D(M)FT PF)

(3) D(M)FS and D(M)FT pooled using a standardized mean difference (SMD)

(4) decayed, (missing) and filled surfaces/teeth prevented fraction (d(m)fs PF and d(m)ft PF). Estimates of the effects on caries increments in the deciduous dentition

(5) Proportion developing new caries in the permanent or deciduous dentition

(6) Compliance with toothbrushing and side effects of toothpaste. Four studies did not report data necessary for inclusion in the analysis but are retained in the review. Either caries increment data were not reported or obtainable (Powell 1981 placebo versus 1000 ppm; Slack 1964 placebo versus 1000 ppm), fluoride concentration was not stated (Kinkel 1972 study states only fluoride versus placebo), or a combination of both (Homan 1969 fluoride toothpaste (three groups SnF₂ and APF) versus placebo).

Standard deviations were missing or not obtainable and subsequently imputed for the following studies: Abrams 1980; Fogels 1979; Forsman 1974; Forsman 1974a; Held 1968; Held 1968a; Held 1968b; James 1977; Muhler 1955; Piccione 1979.

Based on the available data from trials reporting standard deviations of the caries increments, a regression equation to estimate the missing standard deviations was derived for the caries increment D(M)FS and D(M)FT indices. The equations were:

D(M)FS log(sd caries increment) = 0.7574 + 0.491 * log(mean caries increment)

 $D(M)FT \log(sd \text{ caries increment}) = 0.5264 + 0.3811 * \log(mean caries increment).$

(1) Effect on tooth surfaces: D(M)FS PF

Estimates of effect and standard error for pairwise difference(s) with respect to fluoride concentration were calculated in Stata. The

pooled analysis comprised 85 pairwise comparisons resulting from 74 trials with available D(M)FS data. For the purposes of analysis there were 65 comparisons of two fluoride concentrations, seven comparisons of three fluoride concentrations and two comparisons of four fluoride concentrations. Interventions are displayed as a network meta-analysis diagram in Figure 4, where the different interventions are represented as nodes in the network and the links between them represent the pairwise treatment comparisons. The trials formed a connected network. There were 67 placebocontrolled trials, two trials with 250 ppm as baseline, two trials with 440/500/550 ppm as baseline, and 14 trials with 1000/1055/ 1100/1250 ppm as baseline. The model indicated a good fit with a median summary deviation of 80.00 (95% credible interval (CrI) 58.36 to 106.70). Tau was 68.52 (95% CrI 46.15 to 100.30). For each direct comparison the D(M)FS PF and 95% confidence interval (CI) can be viewed in Analysis 1.1 D(M)FS increment (prevented fraction) of the Data and analyses section. Additional Table 1 gives the results of both the direct comparison and network meta-analysis. These are depicted graphically by means of a caterpillar plot (Figure 6) for all the possible pairwise comparisons. The pooled PF increases in favour of higher fluoride as the difference in fluoride concentration increases. For the comparisons with placebo it can be seen from the caterpillar plot that concentrations of 440/500/550 ppm and below show no statistically significant effect when compared to placebo, attaining statistical significance thereafter at concentrations of 1000/1055/1100/1250 ppm with median PF of 23% when compared to placebo (95% CrI 19% to 27%) rising to 36% (95% CrI 27% to 44%) with the highest fluoride concentration. For the active interventions, PF for comparisons of 440/500/550 ppm with higher concentrations only attained statistical significance (PF 20%, 95% CrI 2% to 38%) when compared to 2400/2500/2800 ppm fluoride. All pairwise comparisons are shown in Additional Table 1. The 95% CrIs are relatively wide indicating uncertainty in many of the comparisons, and reflecting the small number of trials for some of the comparisons.

There is evidence of a dose response effect, indicated by the network meta-analysis results in the caterpillar plot, with the magnitude of the prevented fraction increasing as the distance between baseline and higher fluoride concentration increases, though this is not always statistically significant, particularly when fluoride concentrations are lower and similar to baseline concentration.

In terms of the optimum fluoride concentration with greatest prevented fraction, the highest probability of caries preventive benefit was associated with the greater fluoride concentration: the probability was 0.53 for toothpastes containing 2400/2500/2800 ppm fluoride followed by 0.40 for toothpastes containing 1700/2000/ 2200 ppm fluoride.

Meta-regression

Two studies did not include data on baseline levels of caries (Chesters 2002; Segal 1967). The pooled analysis comprised 83 pairwise comparisons resulting from 72 trials. There was very little difference in the fit for this model: median summary deviation of 78.43 (95% CrI 56.99 to 104.60). Tau was 78.43 (95% CrI 44.6 to 99.33). Univariate meta-regression indicated a small association with estimates of D(M)FS PF with baseline level of caries (coefficient 0.38%, 95% CrI -0.23% to 0.99%), though this was not statistically significant.

All studies reported on whether brushing was supervised or not. The pooled analysis comprised 85 pairwise comparisons resulting from 74 trials. The model fit was similar: median summary deviation of 80.38 (95% CrI 58.31 to 107.00). Tau was 71.25 (95% CrI 47.39 to 105.80). Univariate meta-regression indicated an association of D(M)FS PF with supervised brushing (coefficient 5.98%, 95% CrI -0.59% to 12.55%), though this was not statistically significant.

(2) Decayed, (Missing) and Filled Teeth prevented fraction (D(M)FT PF) $% \left({D_{\rm T}} \right) = 0$

Estimates of effect and standard error for pairwise differences with respect to fluoride concentration were calculated in Stata. The pooled analysis comprised 61 pairwise comparisons resulting from 54 trials with available D(M)FT data. For the purposes of analysis there were 49 comparisons of two fluoride concentrations, three comparisons of three fluoride concentrations and two comparisons of four fluoride concentrations). Interventions are displayed as a network meta-analysis diagram in Figure 5, where the different interventions are represented as nodes in the network and the links between them represent the pairwise treatment comparisons. The trials formed a connected network. There were 51 placebo-controlled trials, two trials with 250 ppm as baseline, and eight trials with 1000/1055/1100/1250 ppm as baseline. The model indicated a good fit with a median summary deviation of 57.08 (95% CrI 39.06 to 79.81). Tau was 44.20 (95% CrI 27.27 to 68.85).

For each direct comparison the D(M)FT PF and 95% CI can be viewed in Analysis 1.2 D(M)FT increment (prevented fraction) of the Data and analyses section. Additional Table 2 gives the results of the direct comparison and network meta-analysis. These are depicted graphically by means of a caterpillar plot (Figure 7) for all the possible pairwise comparisons. The PF pooled increases as the difference in concentration increases. For the comparisons with placebo, concentrations of 440/500/550 ppm fluoride and below show no statistically significant effect, attaining statistical significance thereafter with median PF of 25% (95% CrI 19% to 30%) when compared to 1000/1055/1100/1250 ppm fluoride rising to 45% (95% CrI 31% to 58%) when compared to the highest fluoride concentration. For the active comparisons, the magnitude of the differences in fluoride concentration required to attain statistical significance are greater than those of D(M)FS, the more sensitive index. For the active interventions, only the PF for comparisons of 250 ppm with 2400/2500/2800 ppm (PF 31% 95% CrI 8% to 54%) and 1000/1055/1100/1250 ppm fluoride with 2400/2500/2800 ppm (PF 20% 95% CrI 6% to 34%) attain statistical significance. The 95% CrIs are relatively wide indicating uncertainty in many of the comparisons, and reflecting the small number of trials for some of the comparisons.

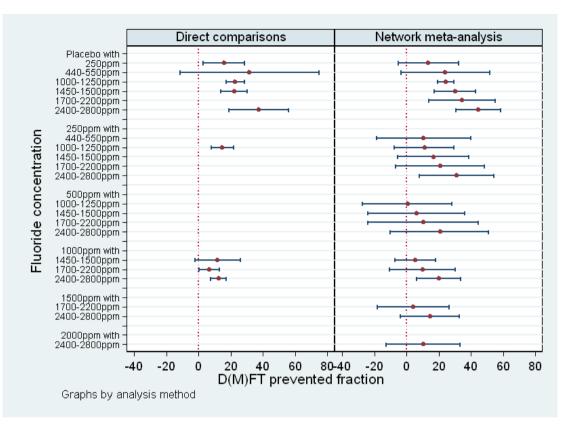

Figure 7. Caterpillar plot D(M)FT PF.

There is evidence of a dose response effect, with the magnitude of the prevented fraction increasing as the distance between baseline and higher fluoride concentration increases, though this is rarely statistically significant, other than for the placebo-controlled trials at concentrations greater or equal to 1000 ppm.

In terms of the optimum fluoride concentration for greatest prevented fraction, the highest probability of caries preventive benefit was associated with the greater fluoride concentration: the probability was 0.72 for toothpastes containing 2400/2500/2800 ppm fluoride followed by 0.17 for toothpastes containing 1700/2000/ 2200 ppm fluoride.

Meta-regression

Eight studies did not include data on baseline level of caries: Abrams 1980; Fogels 1979; Gish 1966; Hanachowicz 1984; Muhler 1955; Muhler 1962; Muhler 1970; Koch 1990. The pooled analysis comprised 53 pairwise comparisons resulting from 46 trials. The model fit was good with a median summary deviation of 49.31 (95% CrI 32.75 to 70.86). Tau was 37.73 (95% CrI 22.20 to 60.95). Univariate meta-regression indicated a small association of D(M)FT PF with baseline level of caries (coefficient -0.93% 95% CrI -3.21% to 1.36%), though this was not statistically significant.

All studies reported on whether brushing was supervised or not. The pooled analysis comprised 61 pairwise comparisons resulting from 54 trials. The model fit was good with a mean summary deviation of 56.66 (95% CrI 38.66 to 79.56). Tau was 46.73 (95% CrI 28.70 to 72.65). Univariate meta-regression indicated an association with estimates of D(M)FT PF with supervised brushing (coefficient 8.67%, 95% CrI -0.45% to 17.94%), though this was not statistically significant.

(3) D(M)FS and D(M)FT pooled using a standardized mean difference (SMD)

Estimates of effect and standard error for pairwise differences with respect to fluoride concentration for both indices were calculated in Stata using Cohen's D.

For each direct comparison the SMD of the two indices and 95% CrIs can be viewed in Analysis 1.3 D(M)FS increment (SMD) and Analysis 1.4 D(M)FT increment (SMD) in the Data and analyses section. Additional Table 3 and Table 4 give the results of the direct comparison and network meta-analysis for D(M)FS and D(M)FT

with SMD. Results from the SMD pooled were materially similar to those obtained from the analysis of PF, with the exception of the placebo versus the highest fluoride concentration. Model fit for these data was relatively poor (D(M)FS 128.7 95% CrI 102.6 to 159.1, Tau 90.27 95% CrI 50.7 to 170.3; D(M)FT 108.60 95% CrI 85.24 to 135.5, Tau 107.4 95% CrI 47.82 to 279.6).

(4) decayed, (missing) and filled surfaces/teeth prevented fraction (d(m)fs PF and d(m)ft PF). Estimates of the effects on caries increments in the deciduous dentition

Two studies provided data for caries increments in both d(m)fs and d(m)ft; two studies provided data for analysis of d(m)ft alone and one study provided data for analysis of dfs alone. One study reporting D(M)FT as the primary outcome also reported the 'dfrate' of deciduous teeth.

d(m)fs comparison 1.5

(Analysis 1.5.)

To evaluate the caries preventive effects of fluoride toothpastes of different concentrations on tooth surfaces of the deciduous dentition one trial compared fluoride toothpaste to placebo and three trials compared toothpastes of different concentrations. The placebo-controlled trial compared a non-fluoridated toothpaste with a toothpaste containing 1500 ppm fluoride (Fan 2008). The PF was 39% (95% CI 29% to 49%) in favour of the fluoride toothpaste. The first compared the caries preventive effects of brushing with toothpaste containing fluoride concentrations of 250 ppm or 1450 ppm (Sonju Clasen 1995). This trial was of a cluster-randomised trial analysed and reported as an individual randomised trial. Using an intra-cluster coefficient of 0.05 with the average cluster size of 17.2, a design effect of 1.81 was calculated (Higgins 2008) and the standard error of the PF adjusted accordingly. This resulted in an increased standard error from 18.3 ignoring clustering to 24.6. The PF was 41.4% (95% CI -6.87% to 89.67%) in favour of the 1450 ppm fluoride toothpaste. A second trial compared the effects of brushing with toothpaste containing fluoride concentrations of 550 ppm versus 1055 ppm (Winter 1989). The PF was 9% (95 % CI -15% to 33%). Lima 2008 evaluated caries progression/arrest by initial caries status and reported no statistically significant difference in the mean number of new lesions in the caries inactive group but a highly statistically significant difference in net caries increment for the caries active group in favour of 1100 ppm fluoride toothpaste when compared to 500 ppm fluoride toothpaste.

Due to the small number of trials for this outcome a meta-regression was not undertaken.

d(m)ft comparison 1.6

(Analysis 1.6.)

These trials reported caries increment at the d(m)ft level. For the Sonju Clasen 1995 study, the high PF of 33.3% failed to reach statistical significance (95% CI -21.77% to 88.37%) as did the study by Winter 1989 with a PF of 16% (95 % CI -2% to 34%). In contrast, the study by Davies 2002 comparing the effects of brushing with fluoride concentrations of 440 ppm or 1450 ppm resulted in a statistically significant PF of 11% (95% CI 3% to 19%) in favour of the higher fluoride toothpaste.

In a placebo-controlled trial of 1500 ppm fluoride toothpaste, Cahen 1982 calculated the 'df-rate', denoted as the number of decayed or filled teeth per 100 observed primary teeth. In the placebo group this df-rate was 18.25, with a lower 'df-rate' of 11.45 in the combined fluoride groups.

Due to the small number of trials for this outcome a meta-regression was not undertaken.

(5) Proportion developing new caries in the permanent or deciduous dentition

Seven studies (eight trials) contributed data for the analysis of the proportion of children developing new caries in the permanent dentition; three studies contributing data for the effect on the deciduous dentition. To evaluate the caries preventive effects on the permanent dentition, seven trials utilised a placebo toothpaste. Plotting the pairwise treatment comparisons with respect to fluoride concentration revealed a radial pattern rather than a connected network and so for this outcome direct effects only were compared using the risk ratio. Pooled estimates of effect using a fixed-effect model were calculated for each pairwise comparison. The effect estimates (RR) and 95% CI can be viewed in comparisons 1.7 and 1.8 of the Data and analyses section. The results of the trials were equivocal with two of the pairwise comparisons reaching statistical significance in favour of the fluoride toothpaste: placebo versus 1000/1055/1100/1250 ppm RR(fixed) 0.88 (95% CI 0.82 to 0.95) and placebo versus 1450/1500 ppm RR(fixed) 0.95 (95% CI 0.91 to 0.98). The direct comparison of 1000/1055/1100/1250 ppm with 1450/1500 ppm did not reach statistical significance RR(fixed) 1.07 (95% CI 1.00 to 1.14) and overall, the pooled effect was not statistically significant RR 0.98 (95% CI 0.94 to 1.02).

Three studies of fluoride toothpastes of different concentrations presented data on the proportion of children developing new caries in the primary dentition (Davies 2002; Sonju Clasen 1995; Winter 1989). For this outcome direct effects only were compared using the risk ratio. Pooled estimates of effect using a fixed-effect model were calculated for the three direct pairwise comparisons. The effect estimates (RR) and 95% CI can be viewed in comparison 1.8 of the Data and analyses section. For the 250 ppm versus 1450 ppm comparison (Sonju Clasen 1995), there was no statistically significant difference in the proportion of children developing new caries (RR 1.01, 95% CI 0.63 to 1.62). The remaining comparisons were statistically significant, favouring higher fluoride con-

centrations (550 ppm compared with 1055 ppm RR(fixed) 0.89, 95% CI 0.80 to 0.99 and 440 ppm compared with 1450 ppm RR(fixed) 0.85, 95% CI 0.78 to 0.93). Overall, the pooled estimate was statistically significant in favour of a higher fluoride concentration (RR 0.87, 95% CI 0.81 to 0.93).

(6) Compliance with toothbrushing and side effects of toothpaste

Sixteen trials assessed possible side effects arising from toothpaste use, principally in terms of oral (soft tissue) pathologies and tooth staining. For the soft tissue findings, six trials reported either no untoward events or no untoward events which could be attributed to the use of the toothpaste (Conti 1988; Fogels 1979; Fogels 1988; Koch 1990; Rule 1984; Stephen 1994). For staining, six trials reported a greater incidence of staining in the stannous fluoride group (Fanning 1968; James 1967; Naylor 1967; Slack 1964; Slack 1967; Slack 1967a). One trial (Jackson 1967) reported no differential staining between the groups (2.5% fluoride group versus 1% placebo group) and no staining was found in another (Fogels 1979).

No side effects were observed or reported in three trials (Fan 2008; Glass 1983; Kleber 1996).

Compliance with toothbrushing was assessed in 21 trials and evaluated either as brushing frequency (<1 per day, 1 per day or >1 per day; average number of (supervised) brushings, attendance at >75% of brushing sessions per week), assessment of toothpaste consumption, or general compliance or co-operativeness with the treatment regimen.

When results were reported by group, two trials found no differential in compliance with regard to toothbrushing frequency (Conti 1988 (374.1 brushings 1000 ppm fluoride group, 370.4 1500 ppm fluoride group out of maximum 450 brushings over a 3year period); Marks 1994 (ranged from 352 to 354 brushings with no statistical significance in mean number of brushing sessions). The proportion of co-operative children was reported in one trial (James 1967) with no differential between the groups (8% versus 6% control).

Some trials reported no problems with compliance and no differential compliance but results were not reported and/or not reported by group. For brushing frequency, Ashley 1977 reported that the mean number of attendances at school brushing sessions did not differ by group; Hanachowicz 1984 reported that 11% of children brushed less than 5 times per week with no differential between the groups. Hodge 1980 reported that 85% of subjects attended >75% of brushing sessions and that less regular attenders distributed evenly between the groups as did Howat 1978 where 58% of subjects attended >75% of brushing sessions. Koch 1990 reported that 65% of participating children brushed more than twice per day when self-reported frequency of brushing was evaluated. Marthaler 1970 reported 680 brushings per year on average, and Marthaler 1970a, Muhler 1962 reported that the average participant brushed 0.9 times per day. O'Mullane 1997 reported similar brushing frequency across the 1000 and 1500 groups, and Stephen 1994 found that 51% brushed more than once per day. Three trials reported that toothpaste usage was virtually similar in each group (Jackson 1967; Marthaler 1965; Marthaler 1965a). Ripa 1988 assessed compliance to the trial regimen by a telephone call to a sample of 150 homes of participating children and found the pattern of compliance "similar for all groups". Likewise, Kleber 1996 reported "no compliance problems". Piccione 1979 reported no differential results.

Results on participant compliance were "reported elsewhere" for one trial (Winter 1989) and not reported at all in another (Fan 2008).

DISCUSSION

Summary of main results

The principal focus of this review was to evaluate the relative effect of toothpastes containing fluoride of different concentrations for preventing caries in children and adolescents. Following a thorough literature search, the number of studies included in the review was 75 (83 trials).

Study results: There is a caries preventive beneficial effect of fluoride toothpastes when used by children and adolescents but not at all concentrations. Using the prevented fraction (PF) as the primary measure of effect, in the placebo-controlled trials, the benefits of increasing fluoride concentration in preventing caries was only statistically significant different from concentrations of 1000/ 1055/1100/1250 ppm and above (D(M)FS PF 23%, 95% credible interval (CrI) 19% to 27%; D(M)FT PF 25%, 95% CrI 19% to 30%) with the PF increasing thereafter. In subjective terms, this may be considered to be of relatively small magnitude but of clinical importance. For the active comparisons, using 250 ppm as the baseline, comparisons with fluoride concentrations of 1000/ 1055/1100/1250 ppm and above are statistically significant, ranging from D(M)FS PF 14%, (95% CrI 1% to 27%); through to 26% (95% CrI 11% to 41%) at concentrations of 2400/2500/ 2800 ppm. There is a greater caries preventive benefit of brushing with a toothpaste containing fluoride concentration of 1000 ppm and higher when compared to brushing with toothpaste containing 250 ppm fluoride. Pairwise comparisons using fluoride concentrations of 440/500/550 ppm and 1000/1055/1100/1250 ppm as a baseline were only statistically significant at the highest level 2400/2500/2800 ppm. Using fluoride concentrations of 1450/1500 ppm or 1700/2000/2200 ppm as a baseline there were no statistically significant benefits of the higher concentrations. There is some evidence of dose response relationship in that the prevented fraction increases as the fluoride concentration increases from the baseline. However the increase in prevented fraction is not always statistically significant. Whilst levels of caries at baseline

and supervised brushing have been previously cited as important effect modifiers, they were not found to be statistically significant in this review.

For the deciduous dentition, two placebo-controlled trials and four trials comparing effects of different fluoride concentrations were included in the review. For both d(m)fs and d(m)ft PF, results of the trials were equivocal. This is not surprising given the different concentrations compared.

In terms of the proportion of children and adolescents developing new caries during the trial, seven studies (eight trials) reported on new caries in the permanent dentition, with three trials reporting new caries in the deciduous dentition. For the permanent dentition the results of the trials were equivocal with two of the three pairwise comparisons reaching statistical significance in favour of the fluoride toothpaste. The direct comparison of 1000/1055/1100/ 1250 ppm with 1450/1500 ppm did not reach statistical significance and overall the pooled effect was not statistically significant risk ratio (RR) 0.98 (95% confidence interval (CI) 0.94 to 1.02). For the deciduous dentition which compared different fluoride concentrations the results were again equivocal, dependent upon the concentrations being compared. Direct pairwise comparisons of fluoride of similar concentrations yielded difference in caries preventive benefit between the different concentrations, though overall, the pooled estimate was statistically significant in favour of a higher fluoride concentration (RR 0.87, 95% CI 0.81 to 0.93).

Overall completeness and applicability of evidence

The review aimed to identify all randomised controlled trials (RCTs) evaluating the use of fluoride toothpastes in the prevention of caries. The present review has explicitly evaluated the preventive effect of fluoride at different levels. However, the review is dominated by studies comparing fluoride concentrations of 1000/ 1055/1100/1250 ppm to placebo. Whilst trials comparing other fluoride concentrations, from 250 ppm to 2500 ppm and which are of importance to clinical practice and policy are included in this review, they are less commonly undertaken. Though the explicit pairwise comparisons of different fluoride concentrations addresses issues important to clinical practice and policy, the lack of trials of different fluoride concentrations and in the different dentitions can be cited as a limitation of the review. The lack of trials in the deciduous dentition, where the potential for harm as a result of caries or fluoride exposure compared to the mixed or permanent dentition is of particular concern.

This review was intended to evaluate the relative caries preventive effect of fluoride toothpastes of different concentrations. Where stated in the trial report, adverse effects such as oral (soft tissue) damage and staining have been documented in the characteristics of included studies table. An important consideration when advocating the use of topical fluoride in children and adolescents in different treatment modalities such as toothpastes, gels varnishes etc. and at different concentrations is the potential for fluorosis arising from fluoride application. A recently published Cochrane review (Wong 2010) concluded that there was no significant association between frequency of toothbrushing and amount of toothpaste used (imperfect proxies for the amounts of fluoride ingested) and fluorosis. With reference to fluoride toothpaste concentration in the deciduous dentition, a meta-analysis of two studies found no statistically significant association between fluoride concentration and fluorosis (RE OR = 0.79, 95% CI 0.61 to 1.02). This result should be interpreted cautiously as the meta-analysis included only two studies and differed in terms of fluoride concentrations being compared (440 ppm with 1450 ppm and 550 ppm with 1000 ppm), duration of exposure and age of initiation of fluoride toothbrushing. To be fully informed of the potential caries preventive benefits of fluoride toothpastes of different concentrations and the potential risks of fluorosis arising from fluoride use both reviews should be read.

The prevented fraction (PF) was chosen to be the primary estimate of effect. The PF was considered to be more appropriate than the absolute mean difference or standardized mean difference as allowed for the combination of different ways in which caries increments are measured across studies, has clinical relevance to researchers as evidenced by its use in caries trials and is simple to interpret by clinicians. The review does not address cost effectiveness in terms of the potential reduction in financial cost associated with caries diagnosis prevention and treatment. However, it should be noted that for constant PF values across different populations the burden of disease (mean number of carious lesions) 'saved' by a higher level of fluoride toothpaste will increase as the underlying amount of disease in the population increases.

In 10 studies, treatment groups receiving additional non-fluoride agents with potential anticaries benefit as part of the intervention were excluded from the analysis if the additional agent was tested in isolated groups for their potential anticaries effect in comparison with either fluoride or placebo groups. Agents identified in trials in this review included secondary calcium pyrophosphate (one trial), heat-treated calcium orthophosphate (one trial), Na N-lauroyl sarcosinate (five trials), calcium phosphate/glycerophosphate (two trials), additional anticalculus agents (one trial). These groups were excluded as their anticaries effects had yet to be established and it is plausible that their addition to toothpaste could exert an additional preventive benefit when compared to formulations which did not receive such additional benefits. However, the influence of such additional agents could have been established through a sensitivity analysis. This will be considered in the review update.

Whilst an indication of the background exposure to fluoride for each of the studies is provided in the characteristics of included studies tables, it is clear that information regarding background exposure is not reported for many. Such a potential effect modifier could have been included in the analysis but due to insufficient information in many of the trial reports this was not undertaken,

and could be identified as a limitation of the review. Nevertheless, potential misclassification, especially due to the incomplete reporting of data for exposure to fluorides other than water (Marinho b 2003) would call for a cautious interpretation of the results of such an analysis.

Quality of the evidence

The included studies range in publication date from 1955 to 2008. The quality of conduct and reporting of RCTs has improved greatly during that time, and that is reflected in the studies included in the review. Many earlier studies lacked information on the methods of randomisation and the process of treatment allocation, hence the large number of studies classified as 'unclear' for these domains. Many studies used stratified randomisation to ensure as far as possible comparable baseline values in terms of unknown and known prognostic indicators, though failing to state the explicit method of randomisation. In terms of allocation concealment, participants were allocated different toothpastes without the involvement of the assessors, with a minimal risk of bias occurring. Of the other key quality domains assessed, the risk of bias is relatively low in trials of toothpastes such as these. Blinding of participants to the allocated toothpaste was done in all but one trial, by ensuring that the products were similarly packaged with taste and appearance, and assessment was carried out by examiners blinded to treatment allocation. Aside from a possible objection to taste, or tooth staining as a result of toothpaste use, lack of blinding would have been of minimal consequence to compliance or outcome assessment. All studies reported caries increment at a surface level as the outcome measure, the primary outcome measure expected to be reported in toothpaste trials, with the majority of studies additionally reporting on caries increment at the tooth level. Risk of bias arising from imbalance of baseline caries levels across groups was low. Stratification according to at least initial caries level was employed and reported in most trials.

The minimally accepted length of follow-up for trials where the outcome is caries increment is 12 months. This minimum duration was an inclusion criterion for the review. A preferred followup period is closer to 3 years, and the caries increment reported closest to this time was chosen as the outcome measure for this review. With such a duration some degree of attrition is to be expected, and largely unrelated to the allocated toothpaste. Reasons reported for attrition were principally due to participants moving schools, or absent from school on the day of the examination. Where participants were reported to be explicitly excluded from participation this was noted, but reflected only a very small proportion of the participants studied. The risk of bias of this domain was unclear for the majority of studies as reasons for drop out and differential losses were not reported. Only four trials were at high risk of bias on this domain as a result of high levels of attrition. A potential source of bias in the review is contamination from other sources of fluoride (toothpaste or otherwise) or co-intervention. If the intervention took place within a school setting contamination is ordinarily unlikely to have occurred, and extremely unlikely to have occurred if the toothbrushing session was carefully supervised or the toothpaste carried the child's name on tube. A possible source of contamination was the use of family toothpaste but this was reduced in studies where sufficient toothpaste was provided for the entire family's use. The risk of bias in this domain was low. In general the studies can be considered to be largely free from bias in terms of the key domains identified, with the exception of randomisation, allocation concealment and incomplete outcome data as discussed above, where the majority of studies received a judgement of 'unclear'.

Potential biases in the review process

There was a single departure from the protocol: the outcome measure proportion of children developing new caries was felt to be a more appropriate measure of prevention than per cent remaining caries free. The latter measure would have excluded all those participants with caries at the commencement of the trial. The proportion of children remaining caries free was therefore removed from the list of outcomes.

No shortcomings in the search strategy were identified by the review authors.

Only three studies are awaiting retrieval or translation (and hence classification).

A limitation of the review in terms of absence of data results from incomplete study characteristics, baseline level of covariates and summary estimates and can be traced back in most cases to the number of years since publication. The review included papers published since 1955, well before the publication of the CON-SORT Statement, and as such important data were omitted in some instances. The many years since publication precluded trying to contact authors for further information. In terms of evaluating the quality of studies, the lack of important information in some of the trial reports has resulted in categorisations of 'unclear'.

The external validity of the review is good, in that the baseline level of caries in the included studies is wide ranging, as is the age of participants at commencement of the studies, and gender is often used as a stratifying factor in the randomisation method. The review includes studies incorporating interventions for use at home and under supervised conditions, usually in a school setting. Metaregression addressed whether such differences in intervention had an effect. The PF was used as the primary outcome measure to ensure that measurements at different indices can be appropriately combined, in an effect measure that is easy to understand and interpret clinically.

For the primary outcome measure PF D(M)FS, there was little evidence of heterogeneity between trials comparing similar levels of fluoride concentration. A meta-regression was formally undertaken with baseline caries and supervised brushing as possible effect modifiers. There was an effect of baseline caries and supervised

brushing on D(M)FS PF (coefficient 0.38%, 95% CrI -0.23% to 0.99% and coefficient 5.98%, 95% CrI -0.59% to 12.55% respectively), though this was not statistically significant, suggesting an anticaries effect of fluoride toothpaste irrespective of initial caries level and supervision of brushing.

Agreements and disagreements with other studies or reviews

Whilst placebo-controlled trials were covered in a previous review (Marinho b 2003), the effect of fluoride toothpastes of different concentrations was only evaluated indirectly, through meta-regression analysis. The review showed an unequivocal effect of fluoride when compared to placebo, and the results of meta-regression analysis suggested a greater treatment effect with increased fluoride concentration, but it drew no firm conclusions as to the relative effectiveness of fluoride toothpastes of different concentrations in preventing dental caries in children and adolescents.

For completeness, comparisons with published reviews will be made but it should be borne in mind that differences in the review process are likely to impact on the results. The present review found evidence of a statistically significant benefit of 250 ppm fluoride toothpaste relative to 1000 ppm fluoride toothpaste for caries prevention in the mixed/permanent dentition (PF D(M)FS 14% 95% CrI 1% to 26%). This result was also found in the two reviews comparing fluoride toothpastes at these concentrations (Ammari 2003; Steiner 2004).

In a review comparing the effects of fluoridated toothpaste compared to placebo and toothpaste of different concentrations, a quality assessment was undertaken and the results were reported narratively (Twetman 2003). An overall effect of fluoride toothpaste when compared to placebo (simple average) was reported in the review comprising 26 trials (Twetman 2003). In the comparison of toothpastes with a fluoride concentration of less than 1000 ppm fluoride relative to 1000-1100 ppm results of four trials were presented narratively indicating either a benefit or no effect of higher fluoride levels. The analysis undertaken in this review suggests that when compared to placebo, fluoride toothpastes of 1000 ppm and above are of benefit (PF D(M)FS 23%, CrI 19% to 27%), and that there is a significant benefit of 1000 ppm fluoride toothpastes when compared to 250 ppm fluoride toothpastes (PF D(M)FS 14%, CrI 1% to 26%). There is no statistically significant additional benefit of 500 ppm fluoride toothpastes compared to 250 ppm fluoride toothpastes (PF D(M)FS 6%, CrI -14% to 26%) or of 1000 ppm fluoride toothpaste compared to 500 ppm fluoride toothpaste (PF D(M)FS 8%, CrI -10% to 25%). The caries preventive effect of fluoride toothpaste containing 1500 ppm fluoride relative to 1000-1100 ppm fluoride was also reported (simple average, n = 9 trials) in favour of higher fluoride concentrations. Whilst the magnitude of effect was similar in this review and also in favour of higher fluoride concentration, this was not statistically significant (PF D(M)FS 6%, 95% CrI -2% to 14%). Finally, a meta-analysis of standard and experimental toothpastes at fluoride concentrations ranging from 1700 ppm, 2200 ppm and 2800 ppm fluoride relative to 1000 ppm fluoride reported a caries preventive effect of higher fluoride concentration, though this was only statistically significant at the 2800 ppm fluoride level (Bartizek 2001). This pattern of results with similar fluoride concentrations was observed in this review (1000/1055/1100/1250 ppm relative to 1700/2000/2200 ppm relative PF D(M)FS 11%, CrI -6% to 28%; 1000/1055/1100/1250 ppm relative to 2400/ 2500/2800 ppm PF D(M)FS 13%, CrI 5% to 20%).

AUTHORS' CONCLUSIONS

Implications for practice

Using the prevented fraction (PF) as the primary measure of effect, in the placebo-controlled trials, the benefits of increasing fluoride concentration in preventing caries was only statistically significant different from concentrations of 1000/1055/1100/1250 ppm and above (D(M)FS PF 23%, D(M)FT PF 25% with the PF increasing thereafter, but concentrations of 440/500/550 ppm and below showed no statistically significant effect when compared to placebo). Based on these results, it may not be appropriate to recommend the use of 440/500/550 ppm fluoride toothpaste for the prevention of caries in the deciduous dentition, whilst acknowledging that there is considerable uncertainty surrounding the estimates at these levels. The use of 1000 ppm or higher in children under 6 years must be made taking into account the risk of fluorosis. The results support the international standard level of 1000 ppm fluoride for younger children and up to 1500 ppm for older children.

Implications for research

More research into the effects of fluoride toothpastes at lower levels of fluoride concentration is needed. Given the current recommended fluoride concentration level in the United Kingdom is around 1500 ppm and around 1000 ppm internationally, studies to evaluate the potential anticaries effects of toothpastes containing lower fluoride concentrations may face ethical difficulties. The majority of studies included in this review come from older, placebo-controlled studies carried out before fluoride was commonly used. As fluoride has become an accepted caries preventive measure then studies directly comparing different fluoride concentrations would be a good addition to the literature. In particular the number of studies evaluating the effects on the deciduous dentition small (six studies), and potential adverse effects of toothpaste use.

ACKNOWLEDGEMENTS

The review authors would like to acknowledge the support of: the Cochrane Oral Health Group, the peer reviewers for their extensive and helpful comments on earlier drafts of this review, and Brian Bonner and Obinna Onwude for their contribution to the assistance with the data extraction and risk of bias assessment respectively.

CHARACTERISTICS OF STUDIES

Characteristics of included studies [ordered by study ID]

Abrams 1980

| Methods | Stratified random allocation; double-blind; placebo-controlled; 48% drop out after 3 years (study duration = 3 years). Reasons for high drop out described: change of residence, absenteeism, non-adherence to study protocol; no differential group losses | |
|---------------|--|--|
| Participants | 1141 children analysed at 3 years (available at final examination). Age range at start: 5-12 years. Surfaces affected at start: 3.2 DFS. Background exposure to fluoride: none reported. Year study began: in/before 1976. Location: USA. | |
| Interventions | FT (2 groups) versus PL (both SnF_2 groups = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: silica gel in one SnF_2 and placebo toothpaste, Ca pyrophosphate in the other SnF_2 toothpaste. | |
| Outcomes | 3yNetDFS increment - (E+U) (CA)cl+(ER)xr. Reported at 1, 2 and 3 years follow-ups. DMFT. DMFS. DFT. MD-DFS. DFT rate. DFS rate. | |
| Notes | Participants randomised (n = 2210). Baseline characteristics (DFS) 'balanced'. Clinical (VT) caries assessment by 2 examiners, diagnostic threshold = CA. Radiographic assessment (postBW) by 2 examiners; diagnostic threshold = ER. State of tooth eruption included = E/U. Intra- and inter-examiner reproducibility of clinical caries diagnosis (DFS) assessed annually by duplicate examination of 10% random sample (percentage of times diagnosis replicated in all 3 examinations ranged 42% to 97% and 77% to 92% for both examiners and for each respectively) | |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: "Children were randomly assigned to one of 3 treatment groups. A stratified sequential sampling technique was used within each school to balance the sample size with respect to sex and grade level for |

Abrams 1980 (Continued)

| | | each dentifrice." Comment: Not enough information pro- vided. |
|--|---------|--|
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "A 3 year double-blind study of a dentifrice containing 0.4% stannous fluo- ride and a placebo" "The examiners at all times were unaware of the children's dentifrice assignment." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 48% in 3 years. Drop out by group: 357/740 FD1, 343/721 FD2, 369/749 PL. Reasons for losses: Change of residence, ab- senteeism, exclusion due to non-adherence to study requirements Comment: Numbers lost were high for the length of follow-up. No differential loss be- tween groups. It is unclear if reasons for missing outcome data are acceptable and balanced. Caries data used in analysis per- tain to participants present at final exami- nation |
| Free of selective reporting? | Yes | Outcomes reported: DFS increment - (E+U) (CA)cl+(ER)xr, re- ported at 1, 2 and 3 years follow-ups. DMFT. DMFS. DFT. MD-DFS. DFT rate. DFS rate. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 2.90 FD1, 3.28 FD2, 2.94 PL Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quotes: "Provisions were made ensuring the randomization process to assure that only one dentifrice code would be available |

Abrams 1980 (Continued)

| | | in each householdA letter to parents was attached, giving brushing instructions and urging use of only the assigned dentifrice." Comment: There is sufficient indication overall of prevention of contamination/co- intervention | |
|---------------|---|--|--|
| Andlaw 1975 | | | |
| Methods | years (study duration = 3 years) | Stratified random allocation; double-blind; placebo-controlled; 13% drop out after 3 years (study duration = 3 years). Main reasons for attrition described: moved away, absent at final examination; no differential group losses | |
| Participants | Age range at start: 11-12 years | | |
| Interventions | Home use/unsupervised, daily | FT versus PL (SMFP group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: Al oxide trihydrate. | |
| Outcomes | | DFT. DMFT. PF-DMFS. MD-BL-DMFS. MD-DMFS. O-DMFS. | |
| Notes | Baseline characteristics (age, d anced'. Clinical (VT) caries assessmen assessment (2 postBW) by 2 e tion included = E/U. Reprodu ducibility of clinical and radio | Clinical (VT) caries assessment by 2 examiners; diagnostic threshold = CA. Radiographic assessment (2 postBW) by 2 examiners; diagnostic threshold = ER. State of tooth eruption included = E/U. Reproducibility ratio was less than 0.22 for intra-examiner reproducibility of clinical and radiographic caries diagnosis; "significant differences between examiners could not have affected caries increment figures since each examined same | |
| Risk of bias | | | |
| Item | Authors' judgement | Description | |

| Andlaw 1975 | (Continued) |
|-------------|-------------|
|-------------|-------------|

| Adequate sequence generation? | Unclear | Quote: "Following baseline examinations, the children were grouped on the basis of age, sex, previous caries experience and the number of erupted 2^{nd} permanent molars; they were then randomly assigned to either the test or control group." Comment: Not enough information pro- vided. |
|--|---------|--|
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "Radiographs were examined without reference to the clinical examina- tion data." "The test dentifrice contained MFPThe toothpastes were packed in similar but dis- tinguishable tubes. The investigators did not know which of the tubes contained the test paste nor which of the pastes any child was using." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 13% in 3 years. Drop out by group: 54/418 FD, 52/428 PL. Reasons for losses: Did not like taste of paste (1 from con- trol group), changed school or moved away (63), exclusion due to absence at last exam- ination Comment: Numbers lost were not unduly high for the length of follow-up, with no differential loss between groups. It is un- clear if reasons for missing outcome data are acceptable and balanced. Caries data used in analysis pertain to participants present at final examination |
| Free of selective reporting? | Yes | Outcomes reported: DFS increment - (E+U) (CA)cl+(ER)xr, re- ported at 3 years follow-up. DMFS. DFT. DMFT. PF-DMFS. MD-BL-DMFS. MD-DMFS. O-DMFS. ECSI. |

| | | Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
|--|-----|---|
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 6.30 (4.04) FD, 6.43 (4.31) PL. Age (years): 11.73 (0.33) FD, 11.69 (0.32) PL. TAR: 17.25 (4.35) FD, 17.35 (4.40) PL. Dental age: 21.75 (4.51) FD, 21.77 (4.47) PL. DFT: 4.52 (2.56) FD, 4.42 (2.66) PL. DMFT: 5.04 (2.68) FD, 4.96 (2.99) PL. DMFS: 8.80 (6.55) FD, 9.10 (7.25) PL. ECSI: 12.03 (8.34) FD, 12.41 (8.66) PL. Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quote: "The distribution of toothpastes and toothbrushes was the responsibility of two ladies called 'home visitors', whose du- ties were to visit each home every 5 weeks to supply enough of the appropriate tooth- paste for the needs of the whole family and maintaining the interest and co-oper- ation of participants throughout the trial." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Ashley 1977

| Methods | Stratified random allocation; double-blind; placebo-controlled; 12% drop out (for all study groups combined) after 2 years (study duration = 2 years). Natural losses; any differential group losses not assessable |
|---------------|--|
| Participants | 489 children analysed at 2 years (available at final examination). Average age at start: 12 years. Surfaces affected at start: 9.1 DFS. Background exposure to fluoride: none. Year study began: 1973. Location: UK. |
| Interventions | FT versus PL (SMFP group = 1000 ppm F). School use/supervised, daily, 1 g applied for 1 min, post-brushing water rinse done (non- fluoride toothpaste provided to all for home use). Abrasive system: IMP (main abrasive). |

Ashley 1977 (Continued)

| Outcomes | 2yNetDFS increment - (E+U) (NCA)cl+(ER)xr. Reported at 2 years follow-up. PF-DFS. MD-BL-DFS. MD-DFS. DFS (U). Compliance. |
|----------|--|
| Notes | Participants randomised (numbers for relevant groups not reported). Baseline characteristics (age, DFS, DMFS, DMFT) 'balanced'. Clinical (V) caries assessment by 1 examiner (FOTI used); diagnostic threshold = NCA. Radiographic assessment (postBW) by 1 examiner; diagnostic threshold = ER. State of tooth eruption included = E/U. Intra-examiner reproducibility checks for incremental caries data (ICC for clinical 0.95, for radiographic 0.8); reversal rate between 12% and 7% of observed DFS increment in study groups |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|--|
| Adequate sequence generation? | Yes | Quote: "Using a table of random numbers, subjects were allocated within each school to one of four study groups." |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "The control dentifrice was iden- tical, except that it did not contain sodium MFP." "The study was organised on a double- blind basis" "Records of earlier examinations were not available at the subsequent examination sessions." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 12% in 2 years (133/1135, all 4 groups combined). Drop out by group: Not reported. Reasons for losses: Mainly due to moving from the area Comment: Numbers lost were not unduly high given length of follow-up; it is unclear if there were any differential losses, and if reasons for missing outcome data are ac- ceptable and balanced. Caries data used in the analysis pertain to participants present |

Interventions

| | | at baseline and final exams. | |
|--|--|--|--|
| Free of selective reporting? | Yes | Outcomes reported: DFS increment - (E+U) (NCA)cl+(ER)xr, reported at 2 years follow-up. PF-DFS. MD-BL-DFS. MD-DFS. DFS (U). Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way | |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 8.44 (5.58) FD, 9.79 (7.28) PL. DMFT: 5.35 (3.03) FD, 6.06 (3.66) PL. DMFS: 9.89 (6.94) FD, 11.05 (7.98) PL. Age: 12.33 FD, 12.28 PL. Comment: Initial caries appears balanced between groups. | |
| Free of contamination/co-intervention? | Yes | Quote: "all subjects received ample sup- plies of the non-fluoride control toothpaste and toothbrushes. This ensured that the ex- posure of the subjects to fluoride dentifrice or rinse was restricted to the experimental regime." Comment: There is sufficient indication overall of prevention of contamination/co- intervention | |
| Biesbrock 2001 | | | |
| Methods | Stratified random allocation; double-blind; 18.5% drop out (for all groups combined) after 1 year (study duration = 3 years). Reasons for attrition not reported | | |
| Participants | 4431 children analysed at 1 year (available at examination). Age range at start: 6-15 years (average = 9). Surfaces affected at start: 5.3 DMFS. Background exposure to fluoride: water <0.3 ppm F in community. Year study began: in/before 2001. Location: USA. | | |

| FT (4 groups) (all groups NaF: 1100 ppm F, 1700 ppm F, 2200 ppm F, 2800 ppm F) |
|--|
| Home use/unsupervised, daily frequency assumed. |
| Abrasive system: silica abrasive. |

Biesbrock 2001 (Continued)

| Outcomes | 1yNet DMFS increment cl+xr, reported at 1 year follow-up. DMFS increment. DMFS increment by surface. DMFT increment. Reported at 1 year follow-up. DMFS increment at years 1, 2 and 3 from baseline exam. |
|----------|--|
| Notes | Participants randomised (n = 5439). Baseline characteristics (age, DMFS, DMFT) 'balanced'. Clinical (VT) caries assessment and radiographic assessment carried out by a single examiner established as "repeatably sensitive" based on prior trial experience Results at years 2 and 3 confounded by a concurrent fluoride rinse programme, which involved half of the study population |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|--|
| Adequate sequence generation? | Unclear | Quote: "randomly assigned to one of the four dentifrice groups." |
| Allocation concealment? | Unclear | Comment: Insufficient information. |
| Blinding? All outcomes | Yes | Quote: "double-blind study." Quote: "They [dentifrices] were supplied in plain white 2.7 oz tubes." Quote: "Subject and examiner blindness to treatment were maintained throughout the study." |
| Incomplete outcome data addressed? All outcomes | Unclear | Comment: 38% drop out at 3 years. No reasons are given for those not examined but similar attrition rate in each of the 4 groups. Not stated but assumed that ITT analysis carried out for those present at exam. No imputation carried out |
| Free of selective reporting? | Unclear | Comment: Unclear but DMFS data not presented by surface for years 2 and 3, un- like year 1 |
| Baseline characteristics balanced? | Yes | Quote: "well balanced with respect to . mean caries experience as measured by DMFS and DMFT at baseline." |
| Free of contamination/co-intervention? | No | Quote "Results at years 2 and 3 confounded by a concurrent fluoride rinse programme. |

Biesbrock 2001 (Continued)

| | " Comment: After 1 year schools partici- pated to varying degrees in a fluoride rinse programme. Only results for 1 year follow- up analysed in review |
|----------------|---|
| Blinkhorn 1983 | |
| Methods | Stratified random allocation; double-blind; placebo-controlled; 10% drop out after 3 years (study duration = 3 years). Reasons for attrition described with respective total numbers: 57 left school, 12 withdrawn by parents, 6 absent at final examination; no differential group losses |
| Participants | 368 children analysed at 3 years (available at final examination). Age range at start: 11-12 years. Surfaces affected at start: 8.2 DMFS. Background exposure to fluoride: none reported. Year study began: 1972. Location: UK. |
| Interventions | FT versus PL (SMFP group = 1000 ppm F). School use/supervised, daily, for 1 min, post-brushing water rinse done (appropriate toothpastes also provided for home use). Abrasive system: IMP (main abrasive). |
| Outcomes | 3yNetDFS increment - (E+U) (CA)cl+(DR)xr. Reported at 3 years follow-up. PF-DFS. MD-BL-DFS. MD-DFS. postMD-DFS. DFS (U). DMFT. anterior DMFT. posterior DMFT. DMFT (U). |
| Notes | Participants randomised (n = 410). Baseline characteristics (DMFS, DMFT, SAR) 'balanced' (DFS baseline data not reported). Clinical (V) caries assessment by 1 examiner, diagnostic threshold = CA. Radiographic assessment (1 postBW) by 1 examiner; diagnostic threshold = DR. State of tooth erup- tion included = E/U. Intra-examiner reproducibility checks for incremental clinical and radiographic caries data in 10% sample (ICC score 0.9) |

Fluoride toothpastes of different concentrations for preventing dental caries in children and adolescents (Review) Copyright © 2010 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

Blinkhorn 1983 (Continued)

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: "The children were allocated to four groups by stratified random sampling at two levels: school and dental age." Comment: Not enough information pro- vided. |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "The trial was organized on a dou- ble-blind basis, neither the children nor the examiner being aware of who was receiving test or control products." "another group used the fluoride den- tifrice and a fourth groupa placebo dentifrice." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 10% in 3 years. Drop out by group: 21/205 FD, 21/205 PL. Reasons for losses: Left school (57), withdrawn by parents (12) , absent at final examination (6) (not re- ported by group) Comment: Numbers lost were not unduly high for the length of follow-up with no differential loss between groups. It is un- clear if reasons for missing outcome data are acceptable and balanced. Caries data used in analysis pertain to participants present at final examination. |
| Free of selective reporting? | Yes | Outcomes reported: DFS increment (E+U) (CA)cl+(DR)xr, re- ported at 3 years follow-up. PF-DFS. MD-BL-DFS. MD-DFS. postMD-DFS. DFS (U). DMFT. Anterior DMFT. Posterior DMFT. DMFT (U). Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |

Blinkhorn 1983 (Continued)

| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFT: 4.94 (2.86) FD, 5.26 (3.47) PL. DMFS: 7.83 (5.17) FD, 8.48 (6.29) PL. SAR: 93.41 (21.30) FD, 93.61 (20.43) PL. Comment: Initial caries appears balanced between groups. |
|--|-----|--|
| Free of contamination/co-intervention? | Yes | Quote: "both dentifrice tubes and rinse bottles were colour coded so that the chil- dren received the correct products. Inde- pendent laboratory checks of the dispensed rinse and dentifrice were made at regular intervals to assess the reliability of the su- pervisors who dispensed agents. The coded dentifrice and rinse was dispensed in the school" Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Brudevold 1966

| Methods | Stratified random allocation; double-blind; placebo-controlled; 25% drop out (for all study groups combined) after 2 years (study duration = 2 years). Reasons for attrition not reported; any differential group losses not assessable |
|---------------|--|
| Participants | 1278 children analysed at 2 years (present for the entire trial period). Average age at start: 7-16 years (average = 12). Surfaces affected at start: 15.7 DFS. Background exposure to fluoride: data not available for fluoridation status of site. Year study began: 1961. Location: USA. |
| Interventions | FT (3 groups)** versus 'PL' (both SnF ₂ groups = 1000 ppm F, APF group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: Ca pyrophosphate in one SnF ₂ toothpaste, IMP in the other SnF ₂ and in the APF toothpaste, control toothpaste abrasive not reported |
| Outcomes | 2yDFS increment - cl+xr. Reported at 2 years follow-up. DMFS. DMFT. DFT. |
| Notes | Participants randomised (numbers for relevant groups not reported). Baseline characteristics (dental age, DFS, DFT, DMFS, DMFT, gender) 'balanced'. Clinical (VT) caries assessment by 2 examiners; diagnostic threshold = CA. Radiographic |

| Cahen 1982 | | |
| Methods | | l; placebo-controlled; 20% drop out after 3 osses and exclusions based on presence in all roup losses not assessable |
| Participants | 2008 children analysed at 3 years (present for all examinations). Age range at start: 6-8 years (average = 7). Surfaces affected at start: 1.4 DMFS (control group only). Background exposure to fluoride: data not obtained for fluoridation status of site. Year study began: 1977. Location: France. | |
| Interventions | FT (2 groups) versus PL (SMFP group = 1500 ppm F, AmF group = 1500 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: IMP in the SMFP and placebo toothpaste, Ca carbonate/Na and Al silicates in the AmF toothpaste | |

Cahen 1982 (Continued)

| Outcomes | 3yDMFS increment - cl+xr. Reported at 3 years follow-up. DMFT. df-rate. |
|----------|---|
| Notes | Participants randomised (n = 2500); numbers by group not reported. Baseline characteristics (age, gender) 'balanced'. Clinical (V) caries assessment by 6 examiners; diagnostic threshold not reported; state of tooth eruption included not reported. Radiographic assessment (2 postBW) by 1 examiner; diagnostic threshold not reported; partial recording. Inter- and intra-examiner reproducibility of clinical and radiographic caries diagnosis assessed in 10% sample ("good reproducibility, no significant difference between or within examiners") |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: "children were stratified by age, sexwere then randomly distributed into 3 groups. Additional modifications were made by placing brothers and sisters in the same groups in order to ensure that only one type of dentifrice entered the house- hold during the trial period." Comment: Not enough information pro- vided. |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "The dentifrices were packed in neutral white tubes with no other inscrip- tion than 'Pate Dentifrice'allocation code was known only by the manufacturer until the final results were obtained." "The whole study was conducted double- blind. The yellow toothpaste was not fluo- ridated and" Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of follow-up: 19.7% in 3 years (492/2500). Drop out by group: Not reported. Reasons for losses: Sickness, change of address, ex- clusion based on presence at all examina- tions (not reported by group) "The balance between boys and girls, and between age groups was preserved in each |

Cahen 1982 (Continued)

| | | treatment groupallowing unbiased com- parisons." Comment: Overall drop out not unduly high for length of follow-up; it is unclear if there were any differential losses, and if reasons for missing outcome data are ac- ceptable and balanced, and how balance be- tween groups was maintained. Caries data used in the analysis pertain to participants present at all examinations |
|--|---|--|
| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - cl+xr, reported at 3 years follow-up. DMFT. df rate. Comment: Trial protocol not available. All pre-specified outcomes were reported and were reported in the pre-specified way |
| Baseline characteristics balanced? | Unclear | Prognostic factors reported: Age and gen- der reported as balanced; DMFS: 1.42 (PL) ; DMFT: 0.98 (PL) Comment: Initial caries derived for the control group only. |
| Free of contamination/co-intervention? | Yes | Quote: "by placing brothers and sisters in the same groups in order to ensure that only one type of dentifrice entered the house- hold during the trial period." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |
| Chesters 2002 | | |
| Methods | Stratified random allocation; double-blind. 15.8% drop out (for all study groups com- bined) after 2 years (study duration = 2 years). Reasons for attrition not reported | |
| Participants | 2011 children analysed at 2 years (available at final examination). Age range at start: 11-14 years (average = 13). Surfaces affected at start: not reported. Background exposure to fluoride: none reported. Year study began: 1999. Location: Lithuania. | |
| Interventions | FT (2 groups) 1000 ppm F SMFP versus 2500 ppm F SMFP. Home use twice daily/unsupervised; daily brushing at school. Abrasive system: silica (both groups). | |

Chesters 2002 (Continued)

| Outcomes | 2yNet DMFS Increment cl(DSTM) FOTI at D ₃ all radiographic lesions. D ₁ MFS Increment (DSTM only). D ₃ MFS Increment (DSTM only). D ₁ MFS Events (DSTM). D ₃ MFS Events (DSTM). Reported at 1 and 2 year follow-up. |
|----------|---|
| Notes | Participants randomised (n = 2387). Baseline characteristics (sex, baseline caries) 'well balanced' No significant D ₁ MFS or D ₃ MFS or baseline differences (values not stated). Exami- nations carried out by a single examiner. Intra-examiner reliability: repeat DSTM and FOTI examinations held throughout the baseline, 12 and 24 month examinations on 5% to 10% of subjects. For radiography, baseline and 12 and 24 month radiographs re- assessed for 5% to 10% of subjects. Reproducibility "excellent", Kappa values >0.8 |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Yes | Quote: "randomized to one of two silica- based dentifrices." Quote: "stratified into 12 strataallo- cated to a product group according to a pre- prepared list of randomized blocks?" |
| Allocation concealment? | Unclear | Comment: Insufficient information. |
| Blinding? All outcomes | Yes | Quote: " double-blind study." Quote: "Neither the subjects, clinical ex- aminers, nor those distributing the test products were aware of the product iden- tities at any time during the trial. The in- vestigators were supplied with sealed code- break envelopes that could be opened in an emergency. This was not required and the integrity of the product code was con- firmed with regular GPC monitoring and independent audit." Quote: "The products were identical except for the fluoride level and different coloured packaging for each product code?" |
| Incomplete outcome data addressed? All outcomes | Yes | 2387 randomised (994/1193 included in final main analysis in low fluoride group; 1017/1194 in high fluoride group) Comment: Not unreasonable drop-out rate; similar in both groups. Reasons un- likely to be due to intervention |

Chesters 2002 (Continued)

| | | Comment: Numbers absent and with- drawn are given for each group. Well bal- anced between groups. No further infor- mation about drop outs given |
|--|--|---|
| Free of selective reporting? | Unclear | Comment: Results reported traditional in- crement and DSTM increment at different levels of diagnosis. DMFT and proportion developing new caries missing. DSTM, FOTI and radiographic assessments |
| Baseline characteristics balanced? | Yes | Comment: Balance of gender and baseline DMFS. |
| Free of contamination/co-intervention? | Unclear | Comment: Unlikely as used different colours for toothpaste tubes/cartons, but possibility of contamination during school brushing sessions |
| Conti 1988 | | |
| Methods | Stratified random allocation; double-blind. 39% drop out (for all study groups com- bined) after 3 years (study duration = 3 years). Reasons for high attrition described: moved, withdrew, absent or not available for examination; no differential group losses | |
| Participants | 2415 children analysed at 3 years (available at final examination). Age range at start: 7-11 years (average = 10). Surfaces affected at start: 2.8 DMFS. Background exposure to fluoride: water <0.3 ppm F in community. Year study began: in/before 1984. Location: USA. | |
| Interventions | FT (2 groups) 1000 ppm SMFP, 1500 ppm SMFP. Home use/supervised brushing at school, daily frequency assumed. Abrasive system: silica (both groups). | |
| Outcomes | 3yNetDFS increment - cl+xr. Reported at 3 years follow-up. DMFS. DMFT. DFT. DFS Prox. Oral (soft tissue) findings. Compliance. | |
| Notes | Participants randomised (n = 3957). Baseline characteristics (age, gender, sound surfaces, DMFT, DMFS) 'balanced'. Clinical examinations carried out by 1 primary examiner and 2 back-up examiners.10% | |

of children randomly selected each year to be re-examined

Risk of bias

| Kisk of ours | | |
|--|--------------------|---|
| Item | Authors' judgement | Description |
| Adequate sequence generation? | Yes | Quote: "stratified according to age and sex and then randomly assigned to one of two treatment groups by a computer pro- gram." |
| Allocation concealment? | Yes | Quote: "assigned by computer program de- signed for this purpose." |
| Blinding? All outcomes | Yes | Quote: "The study was double blind, mul- tiple codes were used for each product, the dentrifices used were identical in appear- ance and flavour and the packaging were similar for both products." |
| Incomplete outcome data addressed? All outcomes | Unclear | 2415/3957 children received clinical and radiographic assessment (39% attrition rate; similar across both groups). Quote: "Moved, withdrew, absent or not available." Comment: Attrition rate was high after 3 years, 38% and 40% in the groups. Al- though reasons for drop outs unlikely to be due to intervention, high rates could influ- ence results |
| Free of selective reporting? | Yes | Comment: Results reported DMFT, DMFS, per cent caries free at 3 years. Clinical and radiogra- phy assessments |
| Baseline characteristics balanced? | Yes | Comment: Comparable age, gender, base- line DMFT DMFS. |
| Free of contamination/co-intervention? | Yes | Comment: School co-ordinators hired and trained to supervise daily toothbrushing. Contamination possible in school brushing sessions but unlikely under supervision |

Davies 2002

| Methods | Random allocation; single-blind (clinical assessors). 32% drop out after 5 years (study duration 5 years). Reasons for attrition: refused to participate (9%), change of residence (19%); product related and dental recommended withdrawals in high fluoride group only (0.07%) |
|---------------|--|
| Participants | 3731 children analysed at 5 years (remained in the study and available at final examination); 5028 children analysed at 5 years (initially allocated to study groups and available at final examination). Age range at start: 12 months. Surfaces affected at start: 0 dmfs. Background exposure to fluoride: none reported. Year study began: 1993 (5 health districts) 1994 (4 health districts). Location: UK. |
| Interventions | FT (440 ppm NaF, 1450 ppm NaF). Control group receiving no intervention also reported.** Home use/unsupervised, daily frequency assumed. Abrasive system: not reported. |
| Outcomes | 5ydmft increment - cl. Reported at 5 years follow-up. mt. Prevalence of caries experience (dmft >0). |
| Notes | Participants initially randomised (n = 7422). Baseline characteristics: not reported. Clinical (VT) caries assessments by trained, standardised, calibrated examiners. Clinical data only. Reliability values not reported **Control group (n = 2462) not considered. |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|---|
| Adequate sequence generation? | Yes | Quote: "randomised controlled parallel group clinical trial." Quote: "centrally allocated to either one of the two test groups or a control group using random number tables." |
| Allocation concealment? | Yes | Quote: "centrally allocated to either one of the two test groups or a control group." Comment: Centralised allocation. |
| Blinding? All outcomes | Unclear | Quote: "Dental examinations were con- ducted under blind conditions but as "off the shelf" toothpaste was delivered to the participants, subjects and their families were aware of which toothpaste they were |

Davies 2002 (Continued)

| | | using." Comment: Clinical assessors blinded, but participants and their families were not. Participants very young children so knowl- edge of intervention unlikely to influence outcome |
|--|--|--|
| Incomplete outcome data addressed? All outcomes | Yes | 1677/2472 available for examination in low fluoride group; 1696/2488 available in the high fluoride group. Total drop-out rate of 32% Comment: Drop-out rate mainly due to refusal to participate, change of residence; product related and dental recommended withdrawals in high fluoride group only but this number is very small. Reasons for drop outs primarily unlikely to be due to inter- vention |
| Free of selective reporting? | Yes | Comment: Routine caries diagnosis. No ra- diographs taken; clinical examination only. Caries indices reported: mt, dmft, caries free |
| Baseline characteristics balanced? | Unclear | Comment: No baseline data presented. Study undertaken in deprived areas of North West of England with comparable caries prevalence in 5 year olds |
| Free of contamination/co-intervention? | Unclear | Comment: Contamina- tion possible. Toothpaste supplied for use by children participating in the trial only and not to other family members |
| Di Maggio 1980 | | |
| Methods | Random allocation; double-blind; placebo-controlled; 16% drop out (for both study groups combined) after 2 years (study duration = 2 years). Main reason for attrition described: left institution; any differential group losses not assessable | |
| Participants | 42 children analysed at 2 years (available at final examination). Age range at start: 11-12 years. Surfaces affected at start: 11.7 DMFS. Background exposure to fluoride: data not obtained for fluoridation status of site. Year study began: in/before 1977. Location: Italy. | |
| Interventions | FT versus PL (SMFP-NaF group = 2500 ppm F). Institution use/supervised, 3 times a day. | |

Di Maggio 1980 (Continued)

| | Abrasive system: not clearly specified. |
|----------|--|
| Outcomes | 2yDMFS increment - cl. Reported at 1 and 2 years follow-ups. DMFT. |
| Notes | Participants randomised (n = 50). Baseline characteristics (DMFS, DMFT) 'balanced'. Clinical caries assessment by 2 examiners; diagnostic threshold not reported; state of tooth eruption included not reported. Diagnostic errors not reported |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: " following a randomisation list the children were allocated to 2 groups" Comment: Not enough information pro- vided. |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "to 2 treatment groups that dif- fered only by the presence or absence of flu- oridethe dentifrices were indistinguish- able by colour or flavour." "using the most strict double-blind con- dition." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 16% (8/50) in 2 years. Drop out by group: Not reported. Reasons for losses: Essentially due to leaving the orphanage Comment: Numbers lost were not unduly high for the length of follow-up. It is un- clear if there were any differential losses, and if reasons for missing outcome data are acceptable and balanced. Caries data used in analysis pertain to participants present at final examinations |
| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - cl, reported at 1 and 2 years follow-ups. DMFT. Comment: Trial protocol not available. All pre-specified outcomes were reported and |

Di Maggio 1980 (Continued)

| | | were reported in the pre-specified way |
|--|-----|---|
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFT: 5.68 FD, 5.90 PL. DMFS: 11.50 FD, 11.85 PL. Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quote: "The institute personnel actively collaborated in controlling the regular den- tifrice use, as prescribed." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

| Allocation concealment? | Unclear | Comment: Insufficient information. |
|--|---------|--|
| Blinding? All outcomes | Yes | Quote: "employed a double-blind" "Dentifrices were packaged in white tubes or overwrapped with white tape so as to mask their identity." |
| Incomplete outcome data addressed? All outcomes | Unclear | Quote: "A total of 1200 qualifying chil- drenentered the study." Quote: "Subjects who did not complete the study dropped out for reasons unrelated to the use of the treatments." Comment: Number randomised/ excluded/withdrawn not reported. |
| Free of selective reporting? | Yes | Mean dfs increment. Clinical (VT) assessment only. |
| Baseline characteristics balanced? | Unclear | Comment: Analysis adjusted for baseline dfs. Baseline data reported for participants completing the trial only. However groups analysed are similar with respect to gender and mean dfs score at baseline |
| Free of contamination/co-intervention? | Unclear | Comment: Insufficient information. Pos- sibility of contamination during brushing sessions |

Fanning 1968

| Methods | Stratified random allocation; double-blind; placebo-controlled; 22% natural drop out after 2 years (study duration = 2 years); no differential group losses (46% drop out based on analysis performed for randomised block design) |
|---------------|--|
| Participants | 844 children analysed at 2 years (422 complete replicates of each group available). Age range at start: 12-14 years (average = 13). Surfaces affected at start: 17.7 DMFS (from sample randomised). Background exposure to fluoride: none. Year study began: 1964. Location: Australia. |
| Interventions | FT** versus PL (SnF ₂ group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: IMP. |

Fanning 1968 (Continued)

| Outcomes | 2yDMFS increment - (CA)cl+(ER)xr. Reported at 2 years follow-up. Stain score. |
|----------|--|
| Notes | Participants randomised (n = 1576). Baseline characteristics (DMFS, DMFT, SAR) 'balanced'. Clinical (VT) caries assessment by 2 examiners; diagnostic threshold = CA. Radiographic assessment (5 BW) by 2 examiners; diagnostic threshold = ER. State of tooth eruption included = E/U. Intra- and inter-examiner reproducibility of clinical caries diagnosis (DFS) assessed annually by duplicate examination of 10% random sample ("error rela- tively small, NS difference between or within examiners") **Na N-lauroyl sarcosinate/SMFP toothpaste group not considered (additional non-F active agent used in this group only) |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|--|
| Adequate sequence generation? | Yes | Quote: "Within each school students were separated into groups according to sex and examiner; within each group they were listed in order of increasing DMFS, and then allotted at random to the treatments by the method of taking successive groups of three subjects from the ordered listsin a randomised block design." |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quote: "At no time was it possible for the examiners or recorders to identify a subject with a dentifrice groupsubjects did not know what dentifrice they were using." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 46.4% in 2 years. Drop out by group: 139/788 FD, 163/788 PL. Reasons for losses: Children leaving school Comment: Numbers lost were unduly high for the length of follow-up. No differen- tial losses between groups. It is unclear if reasons for missing outcome data are ac- ceptable and balanced. Caries data used in analysis pertain to participants in complete randomised blocks at final examination |

Fanning 1968 (Continued)

| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - (CA)cl+(ER)xr, re- ported at 2 years follow-up. Stain score. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
|--|-----|---|
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFS: 19.84 FD, 19.89 PL; SAR: 112.42 FD, 112.58 PL; DMFT: 10.39 FD, 10.39 PL Comment: Initial caries appears balanced between groups. |
| Free of contamination/co-intervention? | Yes | Quotes: "At the beginning of each month, enough dentifrice was sent for the entire family." "All siblings were placed in the same treat- ment group to ensure that only one denti- frice formula was sent to a home." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Fogels 1979

| Methods | Random allocation; double-blind; placebo-controlled; 40% drop out after 3 years (study duration = 3 years). Reasons for attrition described: graduations, change of residence/ school, parental requests, and ortho treatment; no differential group losses |
|---------------|---|
| Participants | 1339 children analysed at 3 years (available at final examination). Age range at start: 6-11 years (average = 9). Surfaces affected at start: 4.9 DFS. Background exposure to fluoride: none reported. Year study began: 1972. Location: USA. |
| Interventions | FT (2 groups) versus PL (both SnF ₂ groups = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: silica gel in one SnF ₂ and placebo toothpaste, Ca pyrophosphate in the other. |
| Outcomes | 3yNetDFS increment - (CA)cl+(ER)xr. Reported at 3 years follow-up. MD-DFS. DFS (U). |

| | DMFT. Oral soft tissues lesions (data not reported). Proportion of children with tooth staining (data not reported) |
|-------|---|
| Notes | Participants randomised (n = 2218). Baseline characteristics (DFS) 'balanced'. Clinical (VT) caries assessment by 2 examiners, diagnostic threshold = CA. Radiographic assessment (postBW) by 2 examiners; diagnostic threshold = ER. State of tooth eruption included E/U. Results shown for each examiner and for the pooled data from both (F- ratios less than unit for examiner by treatment interactions); combined results considered |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|--|
| Adequate sequence generation? | Unclear | Quote: "Children were stratified according to age and sex, and randomly assigned one of the 3 dentifrices." Comment: Insufficient information. |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quote: "Throughout the duration of the study, the double-blind design was main- tained; neither the examiners nor the hy- gienists had access to the identity of the dentifrice codes or to the findings of the previous examination." "Parents were informed that the dentifrices would be assigned randomly and that their children had 1:3 chance to be assigned a non-fluoride dentifrice." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quote: Overall drop out for length of fol- low-up: 40% in 3 years. Drop out by group: 280/731 FD1, 296/735 FD2, 303/752 PL. Reasons for losses: Graduations, change of residence/school, parental requests, and or- tho treatment Comment: Numbers lost are not unduly high for length of follow-up, with no dif- ferential loss between groups. It is unclear if reasons for the missing data are acceptable and balanced. Caries data used in the anal- ysis pertain to participants present at final examinations |

| Free of selective reporting? | Yes | Outcomes reported: DFS increment - (CA)cl+(ER)xr, reported at 3 years follow-up. MD-DFS. DFS (U). DMFT. Oral soft tissues lesions (data not reported) Proportion of children with tooth staining (data not reported) Comment: Trial protocol not available. All pre-specified outcomes were reported and were reported in the pre-specified way |
|--|-----|---|
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 5.69 FD1, 6.04 FD2, 6.04 PL. FS: 2.69 FD, 2,30 FD2, 2.94 PL. Age (months): 114.0 FD, 114.6 FD2, 115. 0 PL. Dental age: 14.93 FD, 15.23 FD2, 15.09 PL. Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quotes: "To avoid assigning two different dentifrices to children in the same house- hold, only one child per family, usually the oldest child, was used in the randomisation." "No evidence of switching dentifrices among children was found." "Care was taken to ensure each child got the correct product." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Fogels 1988

| Methods | Stratified random allocation; double-blind; 20.7% drop out (for all study groups com- bined) after 3 years (study duration = 3 years). Reasons for attrition: withdrawal from the study or absent from final examination; no differential group losses |
|--------------|---|
| Participants | 1913 children analysed at 3 years (available at final examination). Age range at start: 6-11 years (average = 9). Surfaces affected at start: 3.7 DMFS. Background exposure to fluoride: drinking water fluoride adjusted to 1 ppm. Year study began: 1981. Location: USA. |

Fogels 1988 (Continued)

| Interventions | FT (2 groups) 1000 ppm F SMFP and 1500 ppm SMFP. Home use/supervised brushing at school, daily frequency assumed. Abrasive system: silica (both groups). |
|---------------|--|
| Outcomes | 3yNet DMFS increment cl+xr. Reported at 3 years follow-up. DMFT increment. DF Prox. increment. Proportion developing caries. Adverse effects. |
| Notes | Participants randomised (n = 2411). Baseline characteristics (age, gender, DMFS, DMFT, sound surfaces) 'balanced'. 1 trained and calibrated examiner used. 10% of children randomly re-examined to assess consistency of scoring: decayed surfaces 84.7% to 88.9% consistent, filled surfaces 95. 1% to 98.8% consistent 18.8% of children had orthodontic treatment with banded teeth excluded from the analysis and 8.4% were given sealants |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|--|
| Adequate sequence generation? | Unclear | Quote: "subjects were stratified accord- ing to age and sex and were randomly as- signed to one of two fluoride dentifrices." |
| Allocation concealment? | Unclear | Comment: Insufficient information. |
| Blinding? All outcomes | Yes | Quote: "double-blind study." |
| Incomplete outcome data addressed? All outcomes | Unclear | Comment: Attrition rate was moderate af- ter 3 years, 21% and 21% in 1000, 1500 groups Quote: "The drop-outs either withdrew from the study during the course of the trial or were absent at the third year clinical or radiographic examination." Comment: Not given for each group sepa- rately. |
| Free of selective reporting? | Yes | Comment: Results reported DMFT, DMFS, per cent caries free at 3 years |
| Baseline characteristics balanced? | Yes | Comment: Balance of gender, age and caries disease at baseline comparable |

Fogels 1988 (Continued)

| Free of contamination/co-intervention? | Unclear | Comment: Possible in school brushing ses- sions. A proportion of the subjects were fitted with sealants during the course of the study and this proportion was higher (9.6% as opposed to 7.2%) in the higher fluoride group which showed a lower caries incre- ment |
|--|---|---|
| Forsman 1974 | | |
| Methods | Random allocation; double-blind; placebo-controlled; 18% drop out after 2 years (study duration = 2 years). Reasons for attrition described with respective total numbers: change of residence/school, ortho treatment, did not wish to continue; no differential group losses reported (but not assessable) | |
| Participants | 559 children analysed at 2 years (available at final examination). Age range at start: 10-11 years. Surfaces affected at start: 5.1 DMFS. Background exposure to fluoride: mouthrinse. Year study began: in/before 1970. Location: Sweden. | |
| Interventions | FT (3 groups) versus PL (250 ppm NaF, 250 ppm SMFP, 1000 ppm SMFP). Home use/unsupervised, daily frequency assumed. Abrasive system: silica in all toothpastes. | |
| Outcomes | 2yDMFS increment - (NCA)cl. Reported at 2 years follow-up. BLMD-DFS (clin). MD-DFS (x-ray). Proportion of children with new smooth surface caries. | |
| Notes | Participants randomised (n = 681); numbers by group not reported. Baseline characteristics (dental age, DMFS) 'balanced'. Clinical (VT) caries assessment by 1 examiner, diagnostic threshold = NCA. Radio- graphic assessment (postBW) by 1 examiner; diagnostic threshold = ER. State of tooth eruption included not reported. Glass 1978

| Methods | Stratified random allocation; double-blind; placebo-controlled; 35% drop out after 3 years (study duration = 3 years). Natural losses, increased during 3rd year because an entire grade graduated; exclusions based on presence in all follow-up examinations; any differential group losses not assessable |
|---------------|---|
| Participants | 346 children analysed at 3 years (present for all examinations). Age range at start: 6-11 years (average = 9). Surfaces affected at start: 4.1 DFS. Background exposure to fluoride: none reported. Year study began: in/before 1974. Location: USA. |
| Interventions | FT versus PL (SMFP group = 1000 ppm F). School use/supervised, 1 g applied daily (appropriate toothpastes and toothbrushes also provided for home use). Abrasive system: Ca carbonate. |
| Outcomes | 3yNetDFS increment - (CA)cl+(ER)xr. Reported at 1, 2 and 3 years follow-ups. MD-DFS. O-BL-DFS. DFT. CIR. O-BL-CIR. MD-CIR. |
| Notes | Participants randomised (n = 533); numbers by group not reported. Baseline characteristics (age, DFS, DFT, SAR, TAR) 'balanced'. Clinical (VT) caries assessment (FOTI used) by 1 examiner; diagnostic threshold = CA; state of tooth eruption included = E/U. Radiographic assessment (2 postBW) by 1 examiner; diagnostic threshold = ER. Reversals were small in both groups (about 6% of DFS increments) and equally common (NS different) |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|--|
| Adequate sequence generation? | Unclear | Quote: "The initial total of 533 subjects, stratified according to age and sex, were as- signed at random to one of 2 groups." Comment: Not enough information pro- vided. |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "One group brushed with denti- frice containing MFP, the other with the same dentifrice without MFP." |

Glass 1978 (Continued)

| | | "At no time during the clinical examina- tions or during the interpretation of the ra- diographs was the identity of the experi- mental and control group codes known to the examiner or his recorder." Comment: Blind outcome assessment and use of placebo described |
|--|---------|--|
| Incomplete outcome data addressed? All outcomes | Unclear | Quote: Overall drop out for length of fol- low-up: 35% (187/533) in 3 years. Drop out by group: Not reported. Reasons for losses: Left school, exclusion based on pres- ence at all examinations Comment: Numbers lost were not unduly high for length of follow-up. It is unclear if there were any differential losses, and if reasons for missing outcome data are ac- ceptable and balanced. Caries data pertain to participants present at all examinations |
| Free of selective reporting? | Yes | Outcomes reported: DFS increment - (CA)cl+(ER)xr, reported at 1, 2 and 3 years follow-ups. MD-DFS. O-BL-DFS. DFT. CIR. O-BL-CIR. MD-CIR. Comment: Trial protocol not available. All pre-specified outcomes were reported and were reported in the pre-specified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 3.87 (4.22) FD, 4.38 (4.36) PL. Age (months): 108.80 (17.21) FD, 110.16 (18.29) PL. DFT: 2.32 (2.14) FD, 2.73 (2.45) PL. SAR: 63.90 (27.63) FD, 61.63 (24.93) PL. TAR: 11.30 (5.10) FD, 10.38 (4.48) PL. Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quote: "Subjects living at the same street address were assigned to the same group to avoid the presence of two dentifrices in the same household." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Glass 1983

| Methods | Stratified random allocation; double-blind; placebo-controlled; 16% drop out after 2.5 years (study duration = 2.5 years). Natural losses; no losses due to any adverse effects; any differential group losses not assessable |
|---------------|---|
| Participants | 853 children analysed at 2.5 years (available at final examination). Age range at start: 7-11 years (average = 9). Surfaces affected at start: 2.1 DFS. Background exposure to fluoride: water. Year study began: 1976. Location: USA. |
| Interventions | FT (2 groups) versus PL (both SMFP groups = 1000 ppm F). School use/supervised, daily (appropriate toothpastes and toothbrushes also provided for home use). Abrasive system: IMP (main abrasive) in one SMFP and placebo toothpaste, Ca carbonate in the other SMFP toothpaste |
| Outcomes | 2.5yNetDFS increment - (CA)cl+(ER)xr. Reported at 2.5 years follow-up. DFT. CIR. Side effects. |
| Notes | Participants randomised (n = 1017); numbers by group not reported. Baseline characteristics (age, DFS, DFT, SAR, TAR) 'balanced' (for DFT/DFS). Clinical (VT) caries assessment by 2 examiners (independently); diagnostic threshold = CA; state of tooth eruption included = E/U. Radiographic assessment (2 postBW) by 2 examiners (independently); diagnostic threshold = ER. Results of one examiner chosen (findings consistent throughout) |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|--|
| Adequate sequence generation? | Yes | Quote: "within strata, subjects were as- signed group codes using computer gener- ated random permutations of the digits 1, 2 and 3." |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "One group of children brushed with a control dentifrice (no NaMFP), the other groups brushed with one of the den- tifrices containing NaMFP." "The study was conducted in a double- blind basis until the results had been anal- ysed." |

Glass 1983 (Continued)

| | | Comment: Use of placebo described, but blind outcome assessment not described but probably done since earlier report from same author clearly describe blind outcome assessment |
|--|---------|---|
| Incomplete outcome data addressed? All outcomes | Unclear | Quote: Overall drop out for length of follow-up: 16% (164/1017) in 2.5 years. Drop out by group: Not reported. Reasons for losses: Change of residence or school (no losses due to any adverse effect) Comment: Numbers lost were not unduly high for length of follow-up. It is unclear if there were any differential losses, and if rea- sons for missing outcome data are accept- able and balanced between groups. Caries data pertain to participants present at final examination |
| Free of selective reporting? | Yes | Outcomes reported: DFS increment - (CA)cl+(ER)xr, reported at 2.5 years follow-up DFT. CIR. Comment: Trial protocol not available. All pre-specified outcomes were reported and were reported in the pre-specified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 2.20 (2.91) FD1, 2.04 (2.63) FD2, 2.09 (2.53) PL. TAR: 11.40 (4.82) FD1, 11.11 (4.14) FD2, 12.20 (5.11) PL. SAR: 62.65 (25.54) FD1, 60.98 (22.27) FD2, 66.73 (26.63) PL. Age: 8.80 (1.49) FD1, 8.65 (1.41) FD2, 8. 89 (1.46) PL. DFT: 1.59 (1.74) FD1, 1.51 (1.61) FD2, 1.61 (1.69) PL. Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quote: "Sufficient dentifrice was provided for home use by the entire family in order to minimize the chance of use of other than the dentifrice provided." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Hanachowicz 1984

| Methods | Stratified random allocation; double-blind; placebo-controlled; 28% drop out after 3 years (study duration = 3 years). Natural losses and exclusions based on compliance; no differential group losses |
|---------------|---|
| Participants | 945 children analysed at 3 years (available at final examination and co-operative). Age range at start: 10-12 years. Surfaces affected at start: 5.4 DMFS. Background exposure to fluoride: none reported. Year study began: 1979. Location: France. |
| Interventions | FT versus PL (SMFP group = 1500 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: Al oxide trihydrate. |
| Outcomes | 3yNetDMFS increment - (E)(CA)cl+xr. Reported at 3 years follow-up. DMFT. DMFS (U). O-DMFS. MD-DMFS. BL-DMFS. BL-DMFS. premolarDMFT. premolarDMFT. Proportion of children with new caries. Compliance. |
| Notes | Participants randomised (n = 1318). Baseline characteristics (DMFS) 'balanced'. Clinical (VT) caries assessment by 2 examiners; diagnostic threshold = CA; radiographic assessment (2 postBW) by 1 examiner; diagnostic threshold not reported. State of tooth eruption included = E/U. Consistency of clinical and x-ray diagnosis assessed by duplicate examinations of 6% sample (inter-examiner reproducibility ratios 0.24 for clinical and 0.13 for x-ray; intra-examiner reproducibility 0.27 for clinical and 0.14 for x-ray) |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|--|
| Adequate sequence generation? | Unclear | Quotes: "After baseline examination, the children were stratified with regard to their examiner, caries experience Each child was then randomly allocated to the test or toothpaste group. In order that only one type of toothpaste was used in each house- hold an exception was made where two children from one household were partici- patingit was arranged for them to have |

Hanachowicz 1984 (Continued)

| | | the same toothpaste." Comment: Not enough information pro- vided. |
|--|---------|--|
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "Neither the subjects nor the ex- aminers knew who was receiving the test or the control toothpaste." "The control toothpaste was without sodium monofluorophosphate." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quote: Overall drop out for length of fol- low-up: 19.5% in 3 years. Drop out by group: 186/659 FD, 185/659 FD. Reasons for losses: Family moved away (116), lack of co-operation (42) (by not brushing at least 5 times a week), refusal from final examina- tion (30), refused consent for examination (21), moved to boarding school (18), dis- continued (11), family difficulties (6), un- acceptable taste of toothpaste (equally di- vided between groups {5}), illness (2), lost to follow-up (2), unacceptable abrasivity of toothpaste (not reported by group {1}) Comment: Numbers lost were not unduly high for length of follow-up, and showed no differential loss between groups. It is un- clear if reasons for missing data are accept- able and balanced between groups. Caries data pertain to participants present and co- operative at final examination |
| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - (E)(CA)cl+xr, reported at 3 years follow-up. DMFT. DMFS (U). O-DMFS. MD-DMFS. BL-DMFS. premolarDMFT. premolarDMFT. premolarDMFS. Proportion of children with new caries. Comment: Trial protocol not available. All pre-specified outcomes were reported and were reported in the pre-specified way |

Hanachowicz 1984 (Continued)

| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFS: 5.36 FD, 5.43 PL. Comment: Initial caries appears balanced between groups. |
|--|--|--|
| Free of contamination/co-intervention? | Yes | Quotes: "In order that only one type of toothpaste was used in household, an ex- ception was made where two children from one household were participating in the trialit was arranged for them to have the same toothpaste." "The distribution of the toothpastes was the responsibility of three ladiesTheir duty was to visit each home every 5 weeks to supply the whole family with sufficient amounts of toothpaste. This was consid- ered important to prevent the use of other commercial toothpastes." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |
| Held 1968 | | |
| Methods | Stratified random allocation; double-blind; placebo-controlled; 65% drop out after 3 years (study duration = 3 years). Reasons for high drop out due to age range at which many leave the institutions; no differential group losses | |
| Participants | 63 children analysed at 3 years (available at final examination). | |

| Participants | 63 children analysed at 3 years (available at final examination). Age range at start: 15-16 years. Surfaces affected at start: 14.3 DMFS. Background exposure to fluoride: data not available for fluoridation status of site. Year study began: 1962. Location: France. |
|---------------|---|
| Interventions | FT versus PL (NaF-SnF ₂ group = 1000 ppm F). Institution use/supervised, twice a day. Abrasive system: not clearly specified (silica used). |
| Outcomes | 3yDMFS increment - (E) cl. Reported at 3 years follow-up. DMFT. Annual CAR. |
| Notes | Participants randomised (n = 178). Baseline characteristics (DMFS, DMFT) not balanced. Clinical (VT) caries assessment by 1 examiner; diagnostic threshold not reported; state |

of tooth eruption included = E. Intra-examiner reproducibility checks done

| Notes | Participants randomised (numbers for relevant groups not reported). Baseline characteristics (age, SAR, DFS) 'balanced'. Clinical (VT) caries assessment by 1 examiner; diagnostic threshold = CA; state of tooth eruption included = E. Radiographic assessment (2 postBW) by 1 examiner; diagnostic threshold = ER. Intra-examiner reproducibility checks for DFS in 10% sample (ICC for VT/XR over 0.95); error variance less than 5% of total variance; reversal rate less than 5% of observed DFS increment in all groups |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: "Participants were stratified accord- ing to age, sex and then randomly assigned to one of the treatment groups; children from the same family were assigned to the same group." Comment: Not enough information pro- vided. |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "The study was of double-blind design, neither examiner nor participants knowing the identity of the treatment group to which the subjects had been allo- cated." |

Mainwaring 1978 (Continued)

| | | "control group were provided with non- fluoride toothpaste." Comment: Blind outcome assessment and use of placebo described |
|--|---------|--|
| Incomplete outcome data addressed? All outcomes | Unclear | Quote: Overall drop out for length of fol- low-up: 18.4% 386/2104 in 3 years (for all 5 groups). Drop out by group: Not re- ported. Reasons for losses: Not reported Comment: Numbers lost were not unduly high given length of follow-up. It is unclear if there were any differential losses, and if reasons for missing outcome data are ac- ceptable and balanced. Caries data used in analysis pertain to participants present at final examination |
| Free of selective reporting? | Yes | Outcomes reported: DFS increment - (E)(CA)cl+(ER)xr, re- ported at 3 years follow-up. PF-DFS. postMD-DFS. Caries incidence rate. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: Mean age: 142.2 months (for each group). SAR: 87.73 (20.95) FG, 89.38 (20.94) PL. DFS: 8.19 (6.01) FG, 7.59 (5.56) PL. Comment: Initial caries appears balanced between groups. |
| Free of contamination/co-intervention? | Yes | Quote: "Sufficient toothpaste was delivered by specifically appointed home visitors at monthly intervals to the subjects' homes for total family requirements." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Mainwaring 1983

| Methods | Stratified random allocation; double-blind; placebo-controlled; 19% drop out (for all study groups combined) after 4 years (study duration = 4 years). Natural losses, no losses due to any adverse effects; any differential group losses not assessable |
|---------------|--|
| Participants | 682 children analysed at 4 years (available at final examination). Age range at start: 11-12 years. Surfaces affected at start: 6.9 DFS. Background exposure to fluoride: none reported. Year study began: in/before 1978. Location: UK. |
| Interventions | FT (2 groups)** versus PL (SMFP group = 1000 ppm F, SMFP-NaF group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: Ca carbonate in all toothpastes. |
| Outcomes | 4yNetDFS increment - (CA)cl+(ER)xr. Reported at 4 years follow-up. O-DFS. MD-DFS. postMD-DFS. MD-BL-DFS. |
| Notes | Participants randomised (numbers for relevant groups not reported). Baseline characteristics (age, SAR, DFS, FS) 'balanced'. Clinical (VT) caries assessment (FOTI used) by 1 examiner; diagnostic threshold = CA; state of tooth eruption included not reported. Radiographic assessment (2 postBW) by 1 examiner; diagnostic threshold = ER. Intra-examiner reproducibility checks for DFS in 10% sample (ICC for VT/XR over 0.95). **Ca glycerophosphate/SMFP toothpaste group not considered (additional non-F active agent in this group only) |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|---|
| Adequate sequence generation? | Yes | Quote: "The subjects were stratified ac- cording to age and sex, and assigned by means of a table of random numbers to one of four dentifrice groups. Siblings were as- signed to the same group." |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "At no time during the study was the identity of these groups known to the examiner, the subjects or anyone directly associated with the study." "Control group received dentifrice without |

Mainwaring 1983 (Continued)

| | | fluoride." Comment: Blind outcome assessment and use of placebo described |
|--|---------|--|
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 19% 210/1133 in 4 years (all 4 groups). Drop out by group: Not reported. Reasons for losses: Moving away from the area (and no losses due to any adverse ef- fects) Comment: Numbers lost were not unduly high for the length of follow-up. Any dif- ferential losses between groups are not as- sessable. Reasons for missing outcome data are acceptable but it is unclear if they are balanced between groups. Caries data used in analysis pertain to participants present at final examination |
| Free of selective reporting? | Yes | Outcomes reported: DFS increment - (CA)cl+(ER)xr, reported at 4 years follow-up. O-DFS. MD-DFS. postMD-DFS. MD-BL-DFS. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 7.38 (0.37) FD1, 6.85 (0.35) FD2, 6.30 (0.34) PL. FS: 4.87 (0.26) FD1, 4.35 (0.26) FD2, 4. 12 (0.27) PL. SAR: 91.60 (1.38) FD1, 93.04 (1.39) FD2, 90.49 (1.46) PL. Comment: Initial caries appears balanced between groups. |
| Free of contamination/co-intervention? | Yes | Quote: "The dentifrices were delivered to the subjects homes by home visitors calling at monthly intervals. At each visit, suffi- cient toothpaste was provided to satisfy the needs of the whole family." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Marks 1994

| Methods | Stratified random allocation; double-blind; 31.8% drop out (for all study groups com- bined) after 3 years (study duration = 3 years). Reasons for attrition not reported; no differential group losses | |
|---------------|---|--|
| Participants | 5474 children analysed at 3 years (available at final examiation). Age range at start: 6-14 (average = 9). Surfaces affected at start: 2.5 DMFS. Background exposure to fluoride: water <0.3 ppm F in community. Year study began: 1983. Location: USA. | |
| Interventions | FT (5 groups) 1000 ppm F, 1500 ppm F, 2000 ppm F, 2500 ppm F all SMFP, 2000 ppm F NaF Home use/supervised toothbrushing at school, daily frequency. Abrasive system: silica. | |
| Outcomes | 3yDMFS increment - cl xr. Reported at 3 years follow-up. DMFT increment. DFS interproximal increment. Compliance. | |
| Notes | Participants randomised (n = 8027). Baseline characteristics (age, gender, sound surfaces, DMFS, DMFT, DFS Inter) 'very well balanced'. Clinical caries assessment by 1 examiner. Analysis of covariance adjusting for baseline age, gender and DMFS. This is a re-analysis of a previous study with inclusion of 2000 ppm NaF group | |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: "block randomisation scheme was used to balance study groups for age, gender and baseline experience" |
| Allocation concealment? | Unclear | Comment: Insufficient information. |
| Blinding? All outcomes | Yes | Quotes: "double-blind caries trial." "All dentifrices were identical in appear- ance and flavour." Comment: Although not stated examiners probably blinded to group |
| Incomplete outcome data addressed? All outcomes | Unclear | Quote: "Attrition rates ranged from 29.9 per cent in 1000 ppm group to 34.5 in 2000 ppm NaF group and the overall attri- tion rate over all groups was 31.8 per cent. |

Marks 1994 (Continued)

| | | " Comment: No reasons given for losses. |
|--|---------|--|
| Free of selective reporting? | Yes | Comment: DMFT, DMFS, DFS on inter- proximal surfaces increments over 3 years reported |
| Baseline characteristics balanced? | Yes | Comment: Balance of age, gender, baseline caries. Analysis of covariance adjusting for baseline age, gender and DMFS |
| Free of contamination/co-intervention? | Unclear | Comment: Daily supervised toothbrushing and normal home use so contamination unlikely. Insufficient information |

Marthaler 1965

| Methods | Random allocation; double-blind; placebo-controlled; 43% drop out (for all study groups combined) after 3 years (study duration = 7 years). Exclusions based on variation in toothpaste provision and presence in follow-up examinations; any differential group losses not assessable |
|---------------|--|
| Participants | 269 children analysed at 3 years (present for all examinations). Age range at start: 6-9 years (average = 8). Surfaces affected at start: 3.3 DMFS. Background exposure to fluoride: salt (suboptimal). Year study began: 1958. Location: Switzerland. |
| Interventions | FT versus PL (AmF group = 1250 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: IMP. |
| Outcomes | 3yNetDFS increment - (CA)cl+(DR)xr. Reported at 1.5, 3, 5 and 7 years follow-ups. postMD-DFS. antMD-DFS. BL-DFS. O-DFS. DMFT. FT. FT. FS. MT. Compliance. |
| Notes | Participants randomised (numbers for relevant groups not reported). Baseline characteristics (age, DMFS, DMFT) 'balanced' (DFS baseline data not reported) |

Marthaler 1965 (Continued)

| Clinical (V) caries assessment by 1 examiner; diagnostic threshold = CA and NCA; state |
|--|
| of tooth eruption included not reported. Radiographic assessment (2 postBW) by 1 |
| examiner; diagnostic threshold = DR and ER; partial recording. Diagnostic errors not |
| reported |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: "Randomisation was carried out with the aid of the alphabetical class lists. The dentifrices were assigned to the chil- dren listed in this way, in a fixed order ac- cording to the code numbers printed on the tubes. The numbers in turn had been ran- domly assigned to the dentifrices A, B, C, D, E. In this way a random assignment of the dentifrices throughout the school was obtained." Comment: Not enough information pro- vided. |
| Allocation concealment? | Yes | Central allocation described. |
| Blinding? All outcomes | Yes | Quotes: "the examinations were carried out without knowledge of the dentifrice used by the children." "Tubes and content were only distinguish- able with the aid of a small mark printed on the neutral tube." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quote: Overall drop out for length of fol- low-up: 43% 256/589 drop out (for all 5 groups) after 3 years. Drop out by group: Not reported. Reasons for losses: Exclu- sions based on variation in toothpaste pro- vision and presence in follow-up examina- tions (not reported by group) Comment: Numbers lost were high for length of follow-up. It is unclear if there were any differential losses, and if reasons for missing outcome data are acceptable and balanced. Caries data used in the anal- ysis pertain to participants present for all examinations |

Marthaler 1965 (Continued)

| Free of selective reporting? | Yes | Outcomes reported: DFS increment - (CA)cl+(DR)xr, reported at 3 years follow-up. postMD-DFS. antMD-DFS. BL-DFS. O-DFS. O-DFS. DMFT. FT. FS. MT. Comment: Trial protocol not available. All pre-specified outcomes were reported and were reported in the pre-specified way |
|--|---|--|
| Baseline characteristics balanced? | Yes | Prognostic factors reported: Mean age: 7. 6 FD, 7.6 PL; DMFS: 3.45 FD, 3.19 PL; DMFT: 2.39 FD, 2.27 PL Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quote: "In order to exclude exchange of tubes at the start of the study, two tubes of dentifriceswere sent to the parents. The parents were told that upon returning the empty tubes, their child could get new den- tifrice at the local school dental clinic." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |
| Marthaler 1965a | | |
| Methods | Random allocation; double-blind; placebo-controlled; 66% drop out (for all study groups combined) after 3 years (study duration = 3 years). Main reason for high drop out: children leaving public school on completion of last compulsory year; exclusions based on variation in toothpaste provision and presence in all follow-up examinations; any differential group losses not assessable | |
| Participants | 74 children analysed at 3 years (present for all examinations). Age range at start: 11-14 years (average = 13). Surfaces affected at start: 18.9 DMFS. Background exposure to fluoride: salt (suboptimal). Year study began: 1958. Location: Switzerland. | |
| Interventions | FT versus PL (AmF group = 1250 ppm F). Home use/unsupervised, daily frequency assumed. | |

Marthaler 1965a (Continued)

Caries data used in the analysis per- tain to participants present at final exami- nations |
| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - cl, reported at 3 years follow-up. DMFT. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFS: 6.42 (6.30) FD, 6.52 (6.25) PL. Age: 10.88 FD, 11.04 PL. DMFT: 3.95 (2.85) FD, 3.99 (3.02) PL. SAR: 86.30 (29.17) FD, 87.17 (28.88) PL. Comment: Initial caries appears balanced between groups. |
| Free of contamination/co-intervention? | Yes | Quote: "Additional dentifrice was provided for the family of a subject as were brushes. " Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Mitropolous 1984

| Methods | Stratified random allocation; double-blind; 11% drop out. Reasons for attrition: lack of co-operation, own volition, left study schools, absent at time of final examination; no differential group losses |
|--------------|--|
| Participants | 725 children analysed at 32 months (available at final examination). Age range at start 12-13 years (average = not reported). Surfaces affected at start: 7.7 DMFS. |

Mitropolous 1984 (Continued)

| | Background exposure to fluoride: water <0.1 ppm F in community. Year study began: in/before 1982. Location: UK. |
|---------------|--|
| Interventions | FT (2 groups) 1000 ppm F SMPF 250 ppm F SMPF. Home use/unsupervised but some children (n = 477) also brushed at school under supervision. Abrasive system: silica. |
| Outcomes | 32m netDFS increment -cl+xr. Reported at 32 months follow-up. DMFT increment. DFS increment teeth erupting during the study. DMFT increment teeth erupting during the study. |
| Notes | Participants randomised (n = 818). Baseline characteristics (baseline DMFS, baseline DMFT, surfaces at risk) 'balanced'. Clinical caries assessment by 1 examiner. |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Yes | Quote: "stratifiedbefore being ran- domly assigned to one of two study groups. " Comment: As author and statistician on study (HW) the children were randomised using random numbers from random num- ber table |
| Allocation concealment? | Yes | Comment: Not mentioned in trial report, but as author and statistician (HW) this was done |
| Blinding? All outcomes | Yes | Quotes: "trial was double-blind neither the subjects not the examiner being aware who was receiving test or control products." "Control and test dentifrices were indistin- guishable in taste and appearance." |
| Incomplete outcome data addressed? All outcomes | Yes | Quote: "drop-out rate of 11 per cent (32 months)." Quote: "Of the 93 subjects who failed to complete the trial (51 in control and 42 in control), four were removed from the trial through lack of co-operation, three left trial of their own choice, 49 left the study schools and 37 were absent at the time of |

Mitropolous 1984 (Continued)

| | | the examination." Comment: Low drop out (10% test, 12% control), and balanced between the groups. Reasons not connected to toothpaste | |
|--|---|---|--|
| Free of selective reporting? | Yes | Comment: DMFT, DMFS clinical and combined with radiographs, erupting teeth | |
| Baseline characteristics balanced? | Yes | Comment: Balance for baseline gender and caries comparable. | |
| Free of contamination/co-intervention? | Yes | Comment: Pupils received dentifrice for home use through post. 3 of 5 schools had daily brushing sessions. This was checked at regular intervals to assess accuracy of trial supervisors. | |
| Muhler 1955 | | | |
| Methods | | Stratified random allocation; double-blind; placebo-controlled; 22% drop out after 1 year (study duration = 1 year). Reasons for attrition not reported; differential group losses | |
| Participants | 444 children analysed at 1 year (available at final examination). Age range at start: 6-16 years. Surfaces affected at start: 9.3 DMFS. Background exposure to fluoride: data not available for fluoridation status of site. Year study began: in/before 1954. Location: USA. | | |
| Interventions | FT** versus PL (SnF ₂ group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: heat-treated Ca orthophosphate. | | |
| Outcomes | 1yDMFS increment - cl+xr. Reported at 6 months and 1 year follow-ups. DMFT. | | |
| Notes | Participants randomised (n = 568). Baseline characteristics (DMFS) 'balanced'. Clinical (VT) caries assessment by 1 examiner, diagnostic threshold not reported. Ra- diographic assessment by 1 examiner; diagnostic threshold not reported. State of tooth eruption included not reported. Criteria for caries diagnosis reported to have been care- fully standardized, diagnostic errors not reported. **NaF-heat treated Ca orthophosphate toothpaste group not considered (abrasive system known to be incompatible with NaF) | | |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: "After the initial exam of a subject, his total previous caries experience in terms of DMFSwas corrected by a factor cor- responding to his dental age. This factor is one of a series of ratiosThe corrected term was taken as an indication of caries expectancy and the subject assigned to one of nine classes on this basis. Within each class, he was assigned to one of the three treatment groups at random." Comment: Not enough information pro- vided. |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "The examiner had no informa- tion about any child relative to group as- signment, previous exam data, and so on." "The control dentifrice had no fluoride content." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 22% in 1 year. Drop out by group: 71/290 FD, 53/278 PL. Reasons for losses: Not reported Comment: Numbers lost were not unduly high for the length of follow-up, with dif- ferential losses between groups (24.5% FD, 19.1% PL). It is unclear if reasons for miss- ing outcome data are acceptable and bal- anced. Caries data used in analysis pertain to participants present at final examination |
| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - cl+xr, reported at 6 months and 1 year follow-ups. DMFT. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factor reported: DMFS: 9.5 FD, 9.1 PL. |

Muhler 1955 (Continued)

| | | Comment: Initial caries appears balanced between groups. |
|--|-----|--|
| Free of contamination/co-intervention? | Yes | Quote: "The entire family of each child was supplied with the dentifrice assigned to the child. Although this increased the cost of the study considerably, it provided addi- tional assurance that the child would use only the dentifrice assigned." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Muhler 1962

| Methods | Stratified random allocation; placebo-controlled; 30% drop out (for all study groups combined) after 3 years (study duration = 3 years). Reasons for attrition: not stated; no differential group losses | |
|---------------|---|-------------|
| Participants | 343 children analysed at 3 years (available at final examination). Age range at start: 6 to 18 years (average = 11). Surfaces affected at start: 13 DMFS. Background exposure to fluoride: water 0.5 ppm F in community. Year study began: in/before 1958. Location: USA. | |
| Interventions | FT (SnF ₂ = 1000 ppm F) versus PL. Home use/unsupervised, daily frequency assumed. Abrasive system: Ca pyrophosphate. | |
| Outcomes | 3yDMFS increment - cl. Reported at 3 years follow-up. DMFT increment. DMFS increment. Cumulative caries increment. DMFT increment (children present at every examination). DMFS increment (children present at every examination). PMFS increment (children present at every examination). Proportion developing caries. Compliance. | |
| Notes | Participants randomised (n = 492). 3% aged 17 ar 18 at start of study. Baseline characteristics (DMFS) comparable. Clinical caries assessment by 1 examiner. | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| | - | |

Muhler 1962 (Continued)

| Adequate sequence generation? | Unclear | Quote: "assigned at random to study groups after stratification" |
|--|---------|---|
| Allocation concealment? | Unclear | Comment: Insufficient information. |
| Blinding? All outcomes | No | Quote: "Elements of blindness were com- pounded in that subjects from several dif- ferent tests being conducted simultane- ously appeared for examination in mixed order." Comment: Dentifrices were different. Test was described as "standard factory product." |
| Incomplete outcome data addressed? All outcomes | Unclear | Comment: Moderate drop out (36 months 32% control 28% test), and balanced be- tween the groups. No reasons for drop outs given |
| Free of selective reporting? | Yes | DMFS and DMFT increments. |
| Baseline characteristics balanced? | Yes | Comment: Stratified on dental age, past caries, age and gender. Balance for baseline sex, age and disease comparable |
| Free of contamination/co-intervention? | Unclear | Comment: Unclear but as dentifrices were very different it is unlikely that errors oc- curred over their use |

Muhler 1970

| Methods | Stratified random allocation; double-blind; placebo-controlled; 15% drop out after 1 year (study duration = 1 year). Reasons for attrition not reported; differential group losses |
|---------------|--|
| Participants | 436 children analysed at 1 year (available at final examination). Age range at start: 5-16 years (average = 10). Surfaces affected at start: 10.3 DMFS. Background exposure to fluoride: data not available for fluoridation status of site. Year study began: in/before 1967. Location: USA. |
| Interventions | FT** versus PL (SnF ₂ group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: Ca pyrophosphate. |

Muhler 1970 (Continued)

| Outcomes | 1yDMFS increment - cl+xr. Reported at 6 months and 1 year follow-ups. DMFT. |
|----------|---|
| Notes | Participants randomised (n = 510). Baseline characteristics (age, gender, DMFS) with some imbalance. Clinical (VT) caries assessment by 1 examiner, diagnostic threshold not reported. Ra- diographic assessment (5-7 BW) by 1 examiner; diagnostic threshold not reported. State of tooth eruption included not reported. Diagnostic errors not reported **Na N-lauroyl sarcosinate/SMFP toothpaste group not considered (additional non-F active agent used in this group only) |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|--|
| Adequate sequence generation? | Yes | Quote: "children were divided into 3 groups by separation of age, sex and DMFS, followed by randomization with restric- tions to balance by three's within each cell. " Comment: Block randomisation per- formed. |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "The first group of children re- ceived placebo dentifrice" "All dentifrices were furnished in plain white tubes with appropriate codes to iden- tify the products." "At no time during the study did the exam- iner, the recorder or the clinical staff have any knowledge of the patient being exam- ined or the product being used." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 15% in 1 year. Drop out by group: 45/246 FD, 29/264 PL. Reasons for losses: Not reported Comment: Numbers lost were not unduly high for the length of follow-up, but there is differential loss between groups (18% FD, 11% PL). It is unclear if reasons for miss- ing outcome data are acceptable and bal- anced. Caries data used in analysis pertain |

Muhler 1970 (Continued)

| | | to participants present at final examination. Group losses unlikely to be related to inter- vention |
|--|-----|---|
| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - cl+xr, reported at 6 months and 1 year follow-ups. DMFT. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFS: 10.71 FD, 9.72 PL. Age: 10.33 FD, 10.16 PL. Gender: (106 M, 140 F) FD, (120 M, 144 F) PL. Comment: Initial caries appears balanced between groups. |
| Free of contamination/co-intervention? | Yes | Quote: "All the children were given new toothbrushes and sufficient dentifrice for their personal use and for their entire fam- ily." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Naylor 1967

| Methods | Stratified random allocation; double-blind; placebo-controlled; 17% drop out (for all study groups combined) after 3 years (study duration = 3 years). Natural losses; any differential group losses not assessable |
|---------------|--|
| Participants | 973 children analysed at 3 years (available at final examination). Age range at start: 11-12 years. Surfaces affected at start: 9.5 DMFS. Background exposure to fluoride: none reported. Year study began: 1961. Location: UK. |
| Interventions | FT ^{**} versus PL (SnF ₂ group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: IMP (main abrasive) in SnF ₂ toothpaste, dicalcium phosphate (dihy- drate) in placebo toothpaste |

Naylor 1967 (Continued)

| Outcomes | 3ycrudeDFS increment - (E+U) (CA)cl+(ER)xr. Reported at 3 years follow-up. DMFT. DMFS. postMD-DFS. 1stmoMD-DFS. Proportion of children with tooth staining. |
|----------|--|
| Notes | Participants randomised (numbers for relevant groups not reported). Baseline characteristics (age, gender, SAR, DMFS, DMFT, postMD-DFS) 'balanced'. Clinical (VT) caries assessment by 1 examiner; diagnostic threshold = CA; state of tooth eruption included = E/U. Radiographic assessment (2 postBW) by 1 examiner; diagnostic threshold = ER. Reversal rate less than 4% of observed DFS increment in all groups. High accuracy of diagnosis revealed by 10% sample checks (clinically and radiographically) **Na N-lauroyl sarcosinate/SMFP toothpaste group not considered (additional non-F active agent used in this group only) |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Yes | Quote: "Subjects were stratified according to age, sex, raceThe stratified population was then divided into three groups A, B and C by means of random numbers." |
| Allocation concealment? | Yes | Quote: "A sealed envelope containing the allocation of the toothpastes to groups was placed in the safe of the Dean, Guy's Hos- pital Medical School before the trial began and not opened until analysis of third year results were complete." |
| Blinding? All outcomes | Yes | Quote: "Throughout the trial, each group received the corresponding toothpaste, the formular of which was unknown to both the examiner and the user" Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 16.9% (300/1789) in 3 years (for all 3 groups). Drop out by group: Not re- ported. Reasons for losses: "low drop out due to the fact that exams were completed before school leaving age." Comment: Numbers lost were not unduly high for the length of follow-up. It is un- |

| | | clear if there were any differential losses, and if reasons for missing outcome data are acceptable and balanced. Caries data used in the analysis pertain to participants present at final examinations |
|--|-----|--|
| Free of selective reporting? | Yes | Outcomes reported: DFS increment - (E) (CA)cl+(ER)xr, re- ported at 3 years follow-up. DFT. DFT (U). O-BL-DFS. MD-DFS. CIR. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 7.36 FD, 7.62 PL Mean age: 11.94 (0.30) FD, 11.94 (0.30) PL. TAR: 17.6 FD, 17.66 PL. DFT: 4.99 FD, 5.08 PL. SAR: 95.84 FD, 96.21 PL. Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quote: "Sufficient supplies were also left for all other members of the family." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

O'Mullane 1997

| Methods | Stratified random allocation; double-blind; 17% drop out (for all study groups com- bined) after 3 years (study duration = 3 years). Reasons for attrition: only changing area of residence given; "this did not affect the balance between/among the toothpaste groups." |
|--------------|---|
| Participants | 3467 children analysed at 3 years (available at final examination). Age range at start: 11 to 12 years (average = not stated). Surfaces affected at start: 4.9 DMFS. Background exposure to fluoride: none reported but children from Anglesey were ex- cluded as drinking water was fluoridated. Year study began: 1989. Location: UK. |

O'Mullane 1997 (Continued)

| Interventions | FT (4 groups) ** 1000 ppm NaF 1500 pppm NaF 1000 ppm NaF + 3% TMP 1500 pppm NaF + 3% TMP. Home use/unsupervised, daily frequency assumed. Abrasive system: silica. |
|---------------|--|
| Outcomes | 3yDMFS increment cl (VT, FOTI)+xr. Reported at 3 years follow-up. DMFS increment cl. Compliance. Rinsing method. |
| Notes | Participants randomised (n = 4196). Baseline characteristics (DMFS) 'very good'. 2 clinical examiners re-examined 5% of their allocated and 5% of children allocated to the other clinician. Intra- and inter-reliability >0.93. Children who were caries free, dentally immature, or fitted with a fixed orthodontic appliance were excluded from participating in the study. **Factorial design, SMFP and trimetaphosphate (TMP). TMP groups excluded from analysis |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Unclear | Quoted: "prospective participants allo- cated sequential identification numbers" ". children randomly allocated to 1 of 4 toothpaste groups based on 4 stratifying factors." |
| Allocation concealment? | Unclear | Comment: Insufficient information. |
| Blinding? All outcomes | Yes | Quoted: "double-blind" "radiographs were read by clinical examiners without ref- erence to the clinical findings." |
| Incomplete outcome data addressed? All outcomes | Yes | 3467/4196 children available for analysis. Attrition mainly due to moving away from area; did not alter balance between groups Comment: Reasonable drop-out rate for duration of study; unlikely to be due to in- tervention |
| Free of selective reporting? | Yes | DMFS increment. Clinical and radio- graphic assessments. |

O'Mullane 1997 (Continued)

| Item | Authors' judgement | Description | |
|--|--|--|--|
| Risk of bias | | | |
| Notes | Participants randomised (n = 1136); numbers by group not reported. Baseline characteristics (DMFS, DMFT, dental age) 'balanced'. Clinical (VT) caries assessment by 1 examiner; diagnostic threshold not reported; state of tooth eruption included not reported; radiographic assessment (3 BW) by 1 examiner; diagnostic threshold not reported. Diagnostic errors not reported. *Results for 3 years follow-up not considered (not fully reported) | | |
| Outcomes | 2y*DMFS increment - cl+xr. Reported at 1, 2 and 3 years follow-ups. DMFT. O-DMFS. BL-DMFS. MD-DMFS. | | |
| Interventions | FT (2 groups) versus 'PL' (SnF ₂ group = 1000 ppm F, APF group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: Ca pyrophosphate in SnF ₂ toothpaste, IMP in APF toothpaste, control toothpaste abrasive not reported | | |
| Participants | 954 children analysed at 2 years (available at this examination). Age range at start: 9-15 years. Surfaces affected at start: 14.3 DMFS. Background exposure to fluoride: data not available for fluoridation status of site. Year study began: in/before 1964. Location: USA. | | |
| Methods | | Stratified random allocation; double-blind; placebo-controlled; 16% drop out after 2 years (study duration = 3 years). Reasons for attrition not described; any differential group losses not assessable | |
| Peterson 1967 | | | |
| Free of contamination/co-intervention? | Yes | Comment: No apparent cause for concern regarding contamination. Sufficient tooth- paste supplied for whole family so contam- ination unlikely | |
| Baseline characteristics balanced? | Yes | Comment: No statistically significant dif- ference in DMFS score at baseline for NaF only paste (8% lower in 1500 ppm group for combined NaF/NaF+TMP groups) | |

Peterson 1967 (Continued)

| Adequate sequence generation? | Yes | Quote: "Age, sex and family records were supplied to a computing centre, where the subjects were grouped according to these factors and randomly assigned to three groups." Comment: Most likely computer gener- ated sequence used. |
|--|---------|---|
| Allocation concealment? | Yes | Sequence generated centrally. |
| Blinding? All outcomes | Yes | Quotes: "The double blind procedure was used throughout the study." "The dentifrice was supplied in white painted tubes and cartons with 1 of 3 code letters for each dentifrice group." "Group 3, a non-fluoride dentifrice" "Radiographs were developed and read later" Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quote: Overall drop out for length of fol- low-up: 16% (182/1136) in 2 years. Drop out by group: Not reported. Reasons for missing data: Not reported Comment: Numbers lost are not unduly high for length of follow-up. It is unclear if there were any differential losses, and if reasons for missing outcome data are ac- ceptable and balanced. Caries data used in the analysis pertain to participants present at final examination (though it was a 2-year report) |
| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - cl+xr, reported at 1, 2 and 3 years follow-ups. DMFT. O-DMFS. BL-DMFS. MD-DMFS Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFS: 13.91 FD1, 13.65 FD2, 15.20 PL. |

Peterson 1967 (Continued)

| | | DMFT: 7.63 FD1, 7.47 FD2, 8.02 PL. Dental age: 22.61 FD1, 22.62 FD2, 22.77 PL. Comment: Initial caries appears balanced. |
|--|-----|--|
| Free of contamination/co-intervention? | Yes | Quote: "The participating children were periodically supplied with toothbrushes and a sufficient amount of dentifrice, the amount varying according to the size of the family." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Peterson 1979

| Methods | Stratified random allocation; double-blind; placebo-controlled; 25% drop out after 2. 5 years (study duration = 2.5 years). Natural losses; exclusions based on presence in all follow-up examinations; any differential group losses not assessable | |
|---------------|--|-------------|
| Participants | 712 children analysed at 2.5 years (present for all examinations). Age range at start: 8-12 years (average = 10). Surfaces affected at start: 2.9 DFS. Background exposure to fluoride: water. Year study began: 1971. Location: USA. | |
| Interventions | FT (2 groups) versus PL (both SMFP groups = 1000 ppm F). School use/supervised, daily, (appropriate toothpastes also provided for home use). Abrasive system: Ca carbonate in one toothpaste and in placebo toothpaste, IMP in the other SMFP toothpaste | |
| Outcomes | 2.5yDFS increment - cl+xr. Reported at 2.5 years follow-up. DMFT. MD-DFS. | |
| Notes | Participants randomised (n = 950); numbers by group not reported. Baseline characteristics (DFS, MD-DFS, DFT, SAR, TAR) 'balanced'. Clinical (VT) caries assessment (FOTI used) by 1 examiner; diagnostic threshold = CA; state of tooth eruption included not reported; radiographic assessment (postBW) by 1 examiner; diagnostic threshold = ER. Diagnostic errors not reported | |
| Risk of bias | | |
| Item | Authors' judgement | Description |
| | | |

Peterson 1979 (Continued)

| Adequate sequence generation? | Unclear | Quote: "The children were then stratified by age and sex and assigned at random to 1 of 3 dentifrice groups." Comment: Not enough information pro- vided. |
|--|---------|--|
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "Except for the absence of NaMFP, this placebo formulation was identical to that of experimental dentifrice." "The double blind technique was used, nei- ther the examiner nor the subjects knowing to which dentifrice group they had been as- signed." Comment: Blinding outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 25.1% 238/950 in 2.5 years (all groups). Drop out by group: Not reported. Reasons for losses: Mainly due to moving from the area, and exclusion based on pres- ence at all examinations Comment: Numbers lost are not unduly high for length of follow-up. It is unclear if there were any differential losses, and if reasons for missing outcome data are ac- ceptable and balanced. Caries data used in the analysis pertain to participants present for all examinations |
| Free of selective reporting? | Yes | Outcomes reported: DFS increment - cl+xr, reported at 2.5 years follow-up. DMFT. MD-DFS. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 3.04 (3.50) FD1, 2.85 (2.92) FD2, 2.69 (2.66) PL. Age (months): 123.88 (13.01) FD1, 124. (11.94) FD2, 124.64 (12.11) PL TAR: 14.49 (5.10) FD1, 15.16 (5.35) FD2, 14.84 (5.24) PL. |

Peterson 1979 (Continued)

| | | DFT: 2.23 (2.16) FD1, 2.06 (1.71) FD2, 2.05 (1.70) PL. SAR: 79.73 (26.22) FD1, 83.78 (27.28) FD2, 81.53 (26.37) PL. Comment: Initial caries appears balanced. |
|--|-----|--|
| Free of contamination/co-intervention? | Yes | Quote: "All subjects periodically received toothbrushes and dentifrices individually labelled for school and home use." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Piccione 1979

| Methods | Random allocation; blinding not stated; placebo-controlled; drop-out rate 30% after 12 months (study duration = 1 year). Reasons for attrition not reported; no differential group losses |
|---------------|---|
| Participants | Age range at start: 6-11 years. Background exposure to fluoride: none reported. Year study began: in/before 1977. Location: Italy. |
| Interventions | FT (1000 ppm SMFP + 1500 ppm NaF) versus PL. Home use/unsupervised, daily frequency assumed. Abrasive system: not reported. |
| Outcomes | 1yDMFS increment. DMFT. Compliance. |
| Notes | Participants randomised (50). Baseline characteristics (DMFS, DMFT) 'homogeneous'. |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|--|
| Adequate sequence generation? | Unclear | Quote: "at random, subjects were as- signed to one of two groups" |
| Allocation concealment? | Unclear | Comment: Insufficient information. |
| Blinding? All outcomes | Unclear | Comment: Insufficient information. |

Piccione 1979 (Continued)

| Incomplete outcome data addressed? All outcomes | Unclear | 35/50 available for analysis. No reasons given; did not alter balance between groups 30% drop-out rate at 1 year. |
|--|--|---|
| Free of selective reporting? | Unclear | Caries indices reported. Unclear whether clinical and/or radiographic data reported |
| Baseline characteristics balanced? | Unclear | Comment: Baseline characteristics (DMFS, DMFT) 'homogeneous' |
| Free of contamination/co-intervention? | Unclear | Comment: Possible contamination. Suffi- cient toothpaste supplied for trial partici- pant only |
| Powell 1981 | | |
| Methods | Stratified random allocation; double-blind; placebo-controlled; drop-out rate not re- ported nor obtainable (study duration = 4 years). Reasons for attrition not reported; any differential group losses not assessable | |
| Participants | 125 children analysed at 4 years (subjects who developed caries).Age range at start: 12-14 years.Surfaces affected at start: 21.4 DMFS (from sample above).Background exposure to fluoride: none reported.Year study began: 1963.Location: Australia. | |
| Interventions | FT (pp/Plsol) versus PL (pp/Plsol)** (SnF ₂ group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: Ca pyrophosphate. | |
| Outcomes | Caries increment data not reported nor obtainable. Progression rate of initial carious lesions in MD surfaces of permanent posterior teeth at annual intervals (for 4 years) | |
| Notes | Participants randomised (numbers not reported). Baseline characteristics (age, gender, DMFS) 'balanced'. Radiographic (postBW) enamel caries progression assessment by 1 examiner; state of tooth eruption included = E. High reproducibility of radiographic diagnosis (ICC = 0. 91). **Prior prophylaxis with lava pumice followed by professional application of placebo solution performed every 6 months for 2 years in both relevant groups compared | |
| Risk of bias | | |
| Item | Authors' judgement | Description |

Powell 1981 (Continued)

| Adequate sequence generation? | Unclear | Quote: "subjects were assigned to four groups, using systematic random sampling by age, sex, class, and school." Comment: Not enough information pro- vided. |
|--|---------|---|
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Unclear | Quotes: "To determine the reproducibility of radiographic diagnoses, duplicate read- ings of radiographs taken at 48 month exam were made by the same examiner. To ensure that the examiner had no knowledge of the group, an independent observer randomly selected the subjects and nominated, at ran- dom, one or two lesions from each." "Participants issued with either test or con- trol dentifrice for the full 4 year period of the study." Comment: Blinding of outcome assessor is mentioned but although it appears that only a small sample was assessed blindly for reproducibility |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: Not reported. Drop out by group: Not reported. Reasons for losses: Not re- ported Comment: It is unclear if numbers lost were high for length of follow-up, if there were any differential losses, and if reasons for missing outcome data are acceptable and balanced. Caries data used in the analysis pertain to participants who had developed caries at final examination |
| Free of selective reporting? | Yes | Outcomes reported: Caries increment (data not obtainable). Progression rate of initial carious lesions in MD surfaces of permanent posterior teeth at annual intervals (for 4 years). Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFS: 21.2 (0.90) FD, 21.5 (1.12) PL. Gender (M): 58 FD, 67 PL. |

Powell 1981 (Continued)

| | | Age: 13.4 (0.03) FD, 13.4 (0.04) PL. Comment: Initial caries appears balanced. |
|--|--|--|
| Free of contamination/co-intervention? | Unclear | No information provided. |
| Reed 1973 | | |
| Methods | | ; placebo-controlled; 28% drop out after 2 attrition not described; no differential group |
| Participants | 1525 children analysed at 2 years (available Age range at start: 6-13 years (average = 9). Surfaces affected at start: 3.3 DMFS. Background exposure to fluoride: none rep Year study began: in/before 1970. Location: USA. | |
| Interventions | FT (3 groups) versus PL (NaF groups = 1000 ppm F, 500 ppm F, 250 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: Ca pyrophosphate. | |
| Outcomes | 2yDMFS increment - cl+xr. Reported at 1 and 2 years follow-ups. DMFT. | |
| Notes | | ner; diagnostic threshold not reported; state Radiographic assessment (up to 7 BW) by 1 |
| Risk of bias | | |

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|---|
| Adequate sequence generation? | Yes | Quote: "After initial clinical caries exam- ination, children were placed in strata by age, sex and visual DMFS scores. Children within each strata were assigned by random permutation of four, to one of these denti- frices." |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "The dentifrices were similar in colour, flavour and other consumer proper- |

| | | ties and were supplied in coded tubes. Par- ticipants were not aware of the contents of the assigned dentifrice." "The investigator was unaware of the den- tifrice assignment for the participants dur- ing the examinations and radiographic in- terpretations." Comment: Blind outcome assessment and use of placebo described |
|--|---------|---|
| Incomplete outcome data addressed? All outcomes | Unclear | Quote: Overall drop out for length of fol- low-up: 28% in 2 years. Drop out by group: 151/513 FD1, 150/537 FD2, 142/ 531 FD3, 126/523 PL. Reasons for losses: Not reported Comment: Numbers lost were not unduly high given length of follow-up with some differential losses between 2 groups (29. 4% FD1, 27.9% FD2, 26.7% FD3, 24.1% PL). It is unclear if reasons for the missing outcome data are acceptable and balanced. Caries data used in the analysis pertain to participants present at final examination |
| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - cl+xr, reported at 1 and 2 years follow-ups. DMFT. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |

Ringelberg 1979

| Methods | Stratified random allocation; double-blind; placebo-controlled; 37% drop out after 2. 5 years (study duration = 2.5 years). Reasons for attrition not described; no differential group losses |
|---------------|--|
| Participants | 556 children analysed at 2.5 years (available at final examination). Average age at start: 11 years. Surfaces affected at start: 4.2 DMFS. Background exposure to fluoride: none reported. Year study began: 1973. Location: USA. |
| Interventions | FT (2 groups) versus PL (2 groups) (AmF group = 1250 ppm F, SnF_2 group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: Ca pyrophosphate in SnF_2 toothpaste and its placebo, not reported for AmF and its placebo |
| Outcomes | 2.5yNetDMFS increment - (CA)cl + (DR)xr. Reported at 2.5 years follow-up. DMFT. Stain score. |
| Notes | Participants randomised (n = 888). Baseline characteristics (DMFS, DMFT) 'balanced'. Clinical (VT) caries assessment by 2 examiners, diagnostic threshold = CA. Radiographic assessment (5 BW) by 2 examiners; diagnostic threshold = DR. State of tooth eruption included not reported. Reversal rate between 4% and 9% of observed caries increment in the groups |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|---|
| Adequate sequence generation? | Yes | Quote: "The baseline examinations were stratified by race and sex within each school, and ordered by increasing DMFT. Study group assignments were made by random permutations of seven within each stratum." |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "A double-blind design was used; neither examiner nor subjects were aware of the type of treatment received." "The placebo preparations were all fully formulated like their active fluoride ingre- dient, but did not have the specific active fluoride ingredient." |

Ringelberg 1979 (Continued)

| | | Comment: Blind outcome assessment and use of placebo described |
|--|---------|--|
| Incomplete outcome data addressed? All outcomes | Unclear | Quote: Overall drop out for length of fol- low-up: 37% in 2.5 years. Drop out by group: 111/295 FD1, 111/297 FD2, 52/ 147 PL1, 55/149 PL2. Reasons for losses: Not reported Comment: Numbers lost were not unduly high given length of follow-up with no dif- ferential losses between groups. It is un- clear if reasons for the missing outcome data are acceptable and balanced. Caries data used in the analysis pertain to partici- pants present at final examination |
| Free of selective reporting? | Unclear | Outcomes reported: DMFS increment - (CA)cl+(DR)xr, re- ported at 2.5 years follow-up. DMFT. Stain score. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFT: 2.27 (0.17) FD1, 2.49 (0.20) PL1, 2.15 (0.18) FD2, 2.72 (0.28) PL2 DMFS: 4.21 (0.40) FD1, 4.30 (0.41) PL1, 3.69 (0.34) FD2, 4.95 (0.54) PL2 Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quote: "Family members were supplied with the same dentifrice to encourage the use of the test products only by the study participants during the trial. The dentifrice was mailed to their homes to minimize the possibility of the dentifrice being lost, dis- carded or exchanged." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Ripa 1988

| Methods | Stratified random allocation; double-blind; 34% drop out (for all study groups com- bined) after 3 years (study duration = 3 years). Reasons for attrition: change of residence (54%), withdrew (27.4%), orthodontically banded, absent at final examination; no dif- ferential group losses |
|---------------|---|
| Participants | 2509 children analysed at 3 years (available at final examination). Age range at start: 10-12 years (average = 11). Surfaces affected at start: 3.8 DMFS. Background exposure to fluoride: water <0.1 ppm F in community. Year study began: 1982. Location: USA. |
| Interventions | FT (3 groups) 500 ppm SMFP + 500 ppm NaF 1000 ppm SMFP 1250 ppm SMFP + 1250 ppm NaF. Home use/unsupervised, daily frequency assumed. Abrasive system: IMP then dicalcium phosphate dihydrate for SMFP alone toothpaste; silica for combined SMFP NaF toothpaste |
| Outcomes | 3yDMFS increment - cl Reported at 3 years follow-up. DMFS increment by surface. Compliance. |
| Notes | Participants randomised (n = 3785). Baseline characteristics (age, gender, baseline DMFS) 'comparable'. Clinical caries assessment by 2 calibrated examiners, whose results were pooled and analysed together. No values for reliability |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|---|

Fluoride toothpastes of different concentrations for preventing dental caries in children and adolescents (Review) Copyright © 2010 The Cochrane Collaboration. Published by John Wiley & Sons, Ltd.

postMD-DFS.

Proportion of children with tooth staining.

| Notes | Participants randomised (n = 886). |
|-------|--|
| | Baseline characteristics (age, dental age, DFS, DFT, DMFS, DMFT, TAR) 'balanced'. |
| | Clinical (VT) caries assessment by 1 examiner; diagnostic threshold = CA; state of tooth |
| | eruption included = E/U. Radiographic assessment (2 postBW) by 1 examiner; diagnostic |
| | threshold = ER. Consistency of clinical diagnosis maintained by re-examination of 10% |
| | sample and calibration checks made against reserve examiner |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: "As permission was received for par- ticipation, each child was randomly allo- cated within his own school, to the control and study groups." Comment: Not enough information pro- vided. |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "This 3 year clinical trialwas conducted double-blind." "The films from all 4 examinations were read at the end of the trial by one exam- iner, and charted seperate from the clinical examination data. The examiner did not know to which group the films belonged." "The control dentrifice was essentially the insoluble metaphosphate silica paste as used for the study product." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Yes | Quote: Overall drop out for length of fol- low-up: 21% in 3 years. Drop out by group: 87/443 FD, 103/443 PL. Reasons for losses: Staining: 6 FD, 1 PL; moved away: 29 FD, 39 PL, changed school: 5 FD, 5 PL; parents' request: 5 FD, 6 PL; exclu- sion based on presence at all examinations: 42 FD, 52 PL Comment: Numbers lost were not un- duly high given length of follow-up with no differential losses between groups. Rea- sons for the missing outcome data are ac- ceptable and balanced, except for staining, which although related to the intervention, would not affect outcome due to very small |

| | | loss (causing no obvious imbalance). Caries data used in the analysis pertain to partici- pants present at all examinations |
|--|-----|---|
| Free of selective reporting? | Yes | Outcomes repoted: DFS increment - (E)(CA)cl, reported at 1, 2 and 3 years follow-ups. DFT. DMFS. DMFT. postMD-DFS. Proportion of children with tooth staining. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 8.72 FD, 9.13 PL. DFT: 6.21 FD, 6.06 PL; DMFS: 12.36 FD, 12.25 PL. DMFT: 6.82 FD, 6.86 PL; Age: 12 FD, 12 PL. Dental age: 24.80 FD, 24.33 PL; TAR: 18. 61 FD, 18.27 PL. Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quote: "The dentifrices were supplied by mail to the participants and their families. One tube per person per month in each family was supplied" Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Slack 1967a

| Methods | Random allocation; double-blind; placebo-controlled; 21% drop-out rate after 3 years (study duration = 3 years). Reasons for drop out described with numbers: left school, moved away, staining of teeth, on parents request; exclusions based on presence in all follow-up examinations; no differential group losses |
|--------------|--|
| Participants | 757 children analysed at 3 years, all female (present for all examinations). Age range at start: 11-12 years. Surfaces affected at start: 7 DFS. Background exposure to fluoride: none reported. Year study began: 1962. Location: UK. |

Slack 1967a (Continued)

| Interventions | FT versus PL (SnF ₂ group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: dicalcium pyrophosphate. |
|---------------|--|
| Outcomes | 3yDFS increment - (E) (CA)cl. Reported at 3 years follow-up. DFT. DMFS. DMFT. postMD-DFS. Proportion of children with tooth staining. |
| Notes | Participants randomised (n = 961). Baseline characteristics (age, dental age, DFS, DFT, DMFS, DMFT, TAR) 'balanced'. Clinical (VT) caries assessment by 1 examiner; diagnostic threshold = CA; state of tooth eruption included = E/U. Radiographic assessment (2 postBW) by 1 examiner; diagnostic threshold = ER. Consistency of clinical diagnosis maintained by re-examination of 10% sample and calibration checks made against reserve examiner |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: "These girls were randomly allo- cated within the 18 schools to either the control or study group." Comment: Not enough information pro- vided. |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "The films from all were read at the end of the trial by one examiner, and charted seperate from the clinical examina- tion data. The examiner did not know to which group the films belonged." "The dentifrices were wrapped in non-pro- prietary wrapping and package identified by the manufacturer's code." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Yes | Quote: Overall drop out for length of fol- low-up: 21% in 3 years. Drop out by group: 103/479 FD, 101/482 PL. Reasons for losses: Staining: 2 FD, 0 PL; moved away: 35 FD, 32 PL, changed school: 2 FD, 3 |

| | | PL; parents' request: 7 FD, 3 PL; exclusion based on presence at all examinations: 57 FD, 63 PL Comment: Numbers lost were not unduly high given length of follow-up with no dif- ferential losses between groups. Reasons for the missing outcome data are acceptable and balanced, except for staining, which although related to the intervention, did not affect outcome (very small loss causing no real imbalance). Caries data used in the analysis pertain to participants present at all examinations |
|--|-----|--|
| Free of selective reporting? | Yes | Outcomes reported: DFS increment - (E)(CA)cl, reported at 1, 2 and 3 years follow-ups. DFT. DMFS. DMFT. postMD-DFS. Proportion of children with tooth staining. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 7.18 FD, 6.76 PL; DFT: 4.90 FD, 4. 75 PL; DMFS: 9.23 FD, 9.23 PL; DMFT: 5.31 FD, 5.24 PL; Age: 12 FD, 12 PL; Dental age: 23.98 FD, 23.62 PL; TAR: 19. 06 FD, 18.87 PL Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quote: "To aid co-operation and the op- portunity for personal contact, two home visitors were appointed to deliver the prod- ucts personally. The toothpastes were deliv- ered to the homes of the subjects in quanti- ties sufficient to provide a constant supply for all members of the household." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Slack 1971

| Methods | Random allocation; double-blind; placebo-controlled; 33% drop-out rate after 3 years (study duration = 3 years). Main reasons for drop out: moved away, left school, away on examination day, disliked toothpaste taste, brown staining of teeth; no differential group losses |
|---------------|--|
| Participants | 1110 children analysed at 3 years (available at final examination). Age range at start: 11-12 years. Surfaces affected at start: 11.6 DMFS. Background exposure to fluoride: none reported. Year study began: 1965. Location: UK. |
| Interventions | FT (3 groups) versus 'PL' (Both SnF ₂ groups = 1000 ppm F, APF group = 1000 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: IMP in one SnF ₂ toothpaste and in APF toothpaste, dicalcium py- rophosphate in another SnF ₂ toothpaste; control toothpaste abrasive not reported. |
| Outcomes | 3yCrudeDMFS increment - (CA)cl+(ER)xr. Reported at 3 years follow-up. |
| Notes | Participants randomised (n = 1665). Baseline characteristics (age, gender, DMFS, previous F toothpaste use) 'balanced'. Clinical (VT) caries assessment by 1 examiner; diagnostic threshold = CA; state of tooth eruption included not reported. Radiographic assessment (2 postBW) by 1 examiner; diagnostic threshold = ER. Consistency of clinical diagnosis revealed by 10% sample checks at each examination |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: "The children were randomly allo- cated to groups, apart from brothers, sis- ters and others living in the same house- hold who were allocated to the same group. " Comment: Not enough information pro- vided. |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "Dentifrices were made up in large white tubes marked only with a double let- ter codes 3 fluoride and 1 non-fluoride." "At the time of examination, the examiner had no knowledge of the group to which any child belonged." Comment: Blind outcome assessment and use of placebo described |

| Incomplete outcome data addressed? All outcomes | Unclear | Quote: Overall drop out for length of fol- low-up: 33% in 3 years. Drop out by group: 163/423 FD1, 153/422 FD2, 130/ 412 FD3, 119/408 PL. Reasons for losses: Staining of teeth: 3 FD, 4 PL; unpleasant taste (mainly fluoride groups); moved away, changed school, away on examination day Comment: Numbers lost were not unduly high given length of follow-up with dif- ferential losses between groups (FD1 39%, FD2 34%, FD3 32%, PL 29%). It is un- clear if reasons for the missing outcome data are acceptable and balanced. Caries data used in the analysis pertain to partic- ipants present at final examination. Group losses unlikely to be related to intervention |
|--|---------|--|
| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - (CA)cl+(ER)xr, reported at 3 years follow- up. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFS: 12.20 FD1, 11.59 FD2, 10.87 FD3, 11.81 PL. Mean age: 12 years (all groups). Gender (M/F%): 52.9/47.8 FD1, 52.6/47. 4 FD2, 53/47 FD3, 52.6/47.4 PL Fluoride users (%): 10.4 FD1, 11 FD2, 10. 8 FD3, 10.1 PL. Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quote: "children joining the trial were randomly allocated to 5 groups, apart from brothers, sisters and others living in the same household who were allocated to the same group." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Sonju Clasen 1995

| Methods | Cluster random allocation by kindergarten; single-blind (clinical assessors). 46% drop out after 22 months (study duration 22 months). Reasons for attrition: change in residence or moving to new kindergarten in the area; no differential group losses |
|---------------|--|
| Participants | 172 children analysed at 22 months (available at final examination). Age range at start: 2-5 years (average = 4). Surfaces affected at start: 2.2 dmfs. Background exposure to fluoride: none reported. Year study began: August 1991. Location: Germany. |
| Interventions | FT (250 ppm NaF, 1450 ppm NaF). School use/supervised daily brushing. Abrasive system: silica. |
| Outcomes | 2ydmfs increment - cl. Reported at 2 years follow-up. dmft increment. ds. fs. dt. ft. Proportion remaining caries free. |
| Notes | Participants initially randomised in 10 clusters (n = 319). Baseline characteristics (age, gender, proportion caries free, dmft) comparable. Clinical (VT) caries assessments by 1 examiner. Clinical data only. Intra-examiner reli- ability on 30 children. Scott's pi for dmfs 0.89 Cluster-randomised trial reported as individual randomised. |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|---|
| Adequate sequence generation? | Unclear | Quote: "Salzgitter was divided into five geographical areas from which two kinder- gartens were randomly assigned." |
| Allocation concealment? | Unclear | Comment: Insufficient information. |
| Blinding? All outcomes | Unclear | Quote: "Neither the kindergarten children nor the kindergarten staff were aware of the purpose of the study, nor were they told that a toothpaste containing differ- ent amount of fluoride was given to other kindergartens." Quote: "At the time of the examinations the examiner was not aware if the child be- longed to the study group or not." |

Sonju Clasen 1995 (Continued)

| | | Comment: Clinical assessors blinded, but unclear whether participants and kinder- garten staff blinded. Participants very young children so knowledge of interven- tion unlikely to influence outcome |
|--|---------|--|
| Incomplete outcome data addressed? All outcomes | No | 83/155 available for examination in low fluoride group; 89/164 available in the high fluoride group. Total drop-out rate of 46% Quote: "The majority of children who failed to complete the study either went to new kindergartens in the area or to a lesser extent change residence." Comment: High drop-out rate, mainly due to change of kindergarten or change of res- idence. Although reasons for drop outs un- likely to be due to intervention, high rates could influence results |
| Free of selective reporting? | Yes | Comment: Routine caries diagnosis. No ra- diographs taken; clinical examination only. All possible caries indices are reported: ds, fs, dmfs, dt ft, dmft, caries free. Data on different surfaces also presented |
| Baseline characteristics balanced? | Unclear | Comment: Baseline data only available for those assessed at 22 months Comment: As a cluster-randomised trial more information about the individual clusters is required to evaluate this |
| Free of contamination/co-intervention? | Yes | Comment: Unlikely as cluster randomised. All children used 250 ppm F toothpaste at home but undertook supervised daily brushing with study toothpastes in kinder- garten. Children using fluoride supple- ments were excluded from the study |

Stephen 1988

| Methods | Stratified random allocation; double-blind; 23% drop out (for all study groups com- bined) after 3 years (study duration = 3 years). Reasons for attrition: excluded for non- compliance, withdrew, absent at final examination; no differential group losses |
|--------------|---|
| Participants | 2317 children analysed at 3 years (available at final examination). Age range at start: 11-14 years (average = 12). Surfaces affected at start: 10.2 DMFS. Background exposure to fluoride: not stated. |

Stephen 1988 (Continued)

| | Year study began: 1983. Location: UK. |
|---------------|--|
| Interventions | FT (6 groups)** 1000 ppm SMFP 1500 ppm SMFP 2500 ppm SMFP 1000 ppm SMFP + 0.5% ZCT 1500 ppm SMFP + 0.5% ZCT 2500 ppm SMFP + 0.5% ZCT. Home use/unsupervised, daily frequency assumed. Abrasive system: alumina trihydrate. |
| Outcomes | 3yNetDMFS increment - cl+xr. Reported at 3 years follow-up. DMFS increment by gender, clinician, tooth type, surface type |
| Notes | Participants randomised (n = 3044). Baseline characteristics (baseline DMFS) 'well balanced'. Clinical (VT) caries assessment undertaken by 2 calibrated examiners. 5% re-examined annually by allocated examiner and 5% by alternate examiner. Good intra- (0.92 to 0. 99 clinical, 0.98 to 0.99 radiographic) and inter-examiner (0.92 to 0.97 clinical, 0.99 radiographic) reliability **Equivalent fluoride concentration groups combined for analysis |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|--|
| Adequate sequence generation? | Yes | Quote: "prospective participants were al- located sequential numbers one clinician saw all odd-numbered the other all even- numbered [following baseline examina- tion] children were allocated to one of six toothpaste groups by stratified randomisa- tion using computer constructed ran- dom number tables." |
| Allocation concealment? | Unclear | Comment: Insufficient information. |
| Blinding? All outcomes | Yes | Quote: "double blind." Quote: "The dentrifices were supplied in colour coded tubes, the particular compo- sition of the toothpastes being unknown to the clinicians, home visitors or subjects." |
| Incomplete outcome data addressed? All outcomes | Unclear | 2317/3044 available for analysis. Due to leaving the trial, excluded for non-compli- ance, or absent at examination; did not al- |

| | | ter balance between groups 23% drop-out rate at 3 years. Comment: Some participants were ex- cluded for non-compliance. |
|--|-----|--|
| Free of selective reporting? | Yes | DMFS increment. Clinical and radio- graphic assessments. |
| Baseline characteristics balanced? | Yes | Comment: Baseline caries scores from combined clinical/radiographic data com- parable |
| Free of contamination/co-intervention? | Yes | Comment: No apparent cause for concern regarding contamination. Sufficient tooth- paste supplied for whole family |

Stephen 1994

| Methods | Stratified random allocation; double-blind; 18% drop out (for all study groups com- bined) after 3 years (study duration = 3 years). Reasons for attrition: change of residence/ withdrew (8.4%), absent at final examination (8.6%), fixed orthodontic applicance (1%) ; no differential group losses |
|---------------|---|
| Participants | 3517 children analysed at 3 years (available at final examination). Age range at start: 11-12 years (average = 12). Surfaces affected at start: 7.4 DMFS Background exposure to fluoride: not stated. Year study began: 1988. Location: UK. |
| Interventions | FT (6 groups)** 1000 ppm SMFP 1500 ppm SMFP 1000 ppm NaF 1500 ppm NaF 1000 ppm NaF + 3% TMP 1500 ppm NaF + 3% TMP. Home use/unsupervised, daily frequency assumed. Abrasive system: silica. |
| Outcomes | 3yNetDMFS increment - cl (VT+FOTI). Reported at 3 years follow-up. DMFS increment - xr. Subgingival calculus. Plaque. Oral pathologies (assessed but not reported). Oral hygiene habits (assessed reported in Chestnutt 1998). |

| | Compliance. |
|-------|---|
| Notes | Participants randomised (n = 4294). Selected for participation on grounds of caries in the permanent dentition and dental maturity. Baseline characteristics (DMFS) comparable. 42% of children were radiographed at baseline and 86% at final examination (36% at both); being restricted initially for ethical reasons. Clinical (VT and FOTI) caries assessment by 2 examiners. 5% of children re-examined at each annual examination. Intra- and inter-examiner reliabilities of 0.93 to 0.95 (reliability coefficient) and 0.91 to 0.97 by Kappa for DMFS. All radiographs read by 1 examiner. 5% of radiographs re- assessed for reproducibility. Kappa 0.87 DFS. Analysis adjusted for examiner, baseline caries, baseline calculus, active type and fluoride level, plus all 2-way interactions. ** TMP groups excluded from analysis. Groups with equivalent fluoride concentration combined for analysis |

Risk of bias

| | Clinical (VT) caries assessment by 1 examiner, diagnostic threshold not reported. Ra- |
| | diographic assessment (10 BW) by 1 examiner; diagnostic threshold not reported. State |
| | of tooth eruption included not reported. Check of diagnostic errors done |
| | |

Risk of bias

| Item | Authors' judgement | Description |
|--|--------------------|--|
| Adequate sequence generation? | Unclear | Quote: "The children were stratified ac- cording to age, DMF permanent teeth before dentifrices were assigned randomly within strata. Each formulation of denti- frice was assigned 8 numbers at random. These numbers were arranged into random subsets of three; each subset contained a number for each of the three formulations. This sequence was continued across strata boundaries and repeated until all of the par- ticipating children had been allocated." Comment: Still not enough information provided on the actual method of sequence generation |
| Allocation concealment? | Yes | Quote: "The list of names and dentifrice numbers was forwarded to the grantor, who provided the dentifrices in plain white wax- lined tubes labelled with each child's name, home and cottage numberThe code of dentofrice numbersand the three formu- lations were placed in a sealed envelope and stored in the school safe" |
| Blinding? All outcomes | Yes | Quotes: "The control and experimental dentifrices were identically formulated ex- cept for SnF ₂ which was omitted in the control toothpaste. Both toothpastes were coloured blue." "The participating subjects, as well as the examiner were unaware of the arrangement of numbers into dentifrice groups and the specific formulas throughout the study." Comment: Blind outcome assessment and use of placebo described |
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 32% in 2 years. Drop out by group: |

Thomas 1966 (Continued)

| | | 73/224 FD1, 68/226 FD2, 74/229 PL. Reasons for losses: Not reported Comment: Numbers lost were not unduly high for the length of follow-up with no differential losses between groups. It is un- clear if reasons for missing outcome data are acceptable and balanced. Caries data used in analysis pertain to participants present for the entire study period. |
|--|-----|---|
| Free of selective reporting? | Yes | Outcomes reported: DFS increment - cl+xr, reported at 6 months, 1, 1.5 and 2 years follow-ups. DFT. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DFS: 10.66 FD1, 10.57 FD2, 10.88 PL. DFT: 7.05 FD1, 6.72 FD2, 7.01 PL. Mean age: 11.56 FD1, 11.37 FD2, 11.48 PL. TAR: 12.04 FD1, 11.47 FD2, 11.59 PL. Comment: Initial caries appears balanced between groups. |
| Free of contamination/co-intervention? | Yes | Quote: "The tubes were readily identified by the child's name on the label. Thus it was easy for the housemothers to prevent the children from exchanging toothpaste dur- ing brushing." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Torell 1965

| Methods | Random allocation; double-blind; placebo-controlled; 13% drop-out rate after 2 years (study duration = 2 years). Reasons for attrition: natural losses mainly; no differential group losses |
|--------------|--|
| Participants | 668 children analysed at 2 years (available at final examination). Age at start: 10 years. Surfaces affected at start: 14.5 DMFS (from sample randomised). Background exposure to fluoride: none reported. Year study began: 1962. Location: Sweden. |

Torell 1965 (Continued)

| Interventions | FT (2 groups) versus PL (2 groups) (SnF ₂ group = 1000 ppm F, NaF group = 1100 ppm F). Home use/unsupervised, twice a day instructed but daily frequency assumed, post-brushing water rinse instructed. Abrasive system: Ca pyrophosphate in SnF ₂ toothpaste and its placebo, Na bicarbonate in NaF toothpaste and its placebo |
|---------------|---|
| Outcomes | 2yDMFS increment - (CA)cl. Reported at 1 and 2 years follow-ups. MD-DMFS. FS. Proportion of children with new carious lesions (U)xr. |
| Notes | Participants randomised (n = 766). Baseline characteristics (DMFS, MD-DMFS) 'balanced'. Clinical (VT) caries assessment by 2 examiners, diagnostic threshold = CA; radiographic assessment (BW) by 2 examiners; diagnostic threshold = DR. State of tooth eruption included not reported. Inter- and intra-examiner reproducibility checks done for clinical caries in 4% and 2% sample respectively; duplicate examination of x-rays records done and any discrepancies discussed before final diagnosis |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|---|
| Adequate sequence generation? | Yes | Quote: "The groups were randomly consti- tuted and randomly assigned to the test dif- ferent test methods, according to a system worked out with the assistance of statisti- cians" |
| Allocation concealment? | Unclear | No information provided. |
| Blinding? All outcomes | Yes | Quotes: "The control dentifrice had the same composition with the exception of the fluoride." "On the registration charts the different groups were referred to by their code num- bers. The examiners did not have access to the code during the course of the investi- gation." "The study was a blind test as the examina- tion charts did not refer to the treatment or to the code number of the groups." Comment: Blind outcome assessment and use of placebo described |

Reasons for losses: Not reported Comment: Numbers lost were not unduly high for the length of follow-up with no differential losses between groups. It is un- clear if reasons for missing outcome data are acceptable and balanced. Caries data used in analysis pertain to participants present at final examination |
| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - cl+xr, reported at 1 and 2 years follow-ups. DMFT. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFS: 8.06 FD, 8.02 PL; DMFT: 4.41 FD, 4.37 PL; Age: 8.78 FD, 8.76 PL Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Yes | Quote: "The assigned dentifrice was sup- plied to the entire families of the study participants approximately every 2 months during the study." Comment: There is sufficient indication overall of prevention of contamination/co- intervention |

Zacherl 1981

| Methods | Stratified random allocation; double-blind; placebo-controlled; 43% drop out after 3 years (study duration = 3 years). Reasons for attrition described: change of residence, absent on examination day, poor quality of x-rays; no differential group losses |
|--------------|--|
| Participants | 1754 children analysed at 3 years (available at final examination). Age range at start: 6-13 years (average = 9). Surfaces affected at start: 5.8 DMFS. |

Zacherl 1981 (Continued)

| | Background exposure to fluoride: none reported. Year study began: in/before 1977. Location: USA. | |
|---------------|--|--|
| Interventions | FT (2 groups) versus PL (SnF ₂ group = 1000 ppm F, NaF group = 1100 ppm F). Home use/unsupervised, daily frequency assumed. Abrasive system: Ca pyrophosphate in SnF ₂ and placebo toothpastes, silica in NaF toothpaste. | |
| Outcomes | 3yDMFS increment - (CA)cl+(ER)xr. Reported at 1, 2 and 3 years follow-ups. DMFT. | |
| Notes | Participants randomised (n = 3093). Baseline characteristics (DMFS, DMFT) 'balanced'. Clinical (VT) caries assessment (FOTI used) by 1 examiner, diagnostic threshold = CA. Radiographic assessment (postBW) by 1 examiner; diagnostic threshold = ER. State of tooth eruption included not reported. Intra-examiner reproducibility checks for incre- mental clinical and radiographic caries data in 10% sample (ICC score 0.9). Reversal rate very low and similar among groups | |

Risk of bias

| Item | Authors' judgement | Description |
|-------------------------------|--------------------|---|
| Adequate sequence generation? | Yes | Quote: "Following the baseline examina- tions, the subjects were seperated by sex, age and DMFS. Within these strata, they were assigned to a treatment regimen by random permutations of seven in a 1:3:3 ratio" |
| Allocation concealment? | Unclear | Quote: "Following initial assignment of subjects to treatment groups, the investi- gator was supplied with a file of tamper proof, sealed opaque envelopes which con- tained the name and identification num- ber of each subject. Within each envelope, the treatment identity for the subject was printed." Comment: Allocation concealment should be dealt with prior to not after assignment |
| Blinding? All outcomes | Yes | Quotes: "No situations occurred during the study that required any of the envelopes to be opened. At no time during the course of the study did the examiner or the subjects know which dentifrice the subjects were as- |

Zacherl 1981 (Continued)

| | | signed." "The design used for this study is a modifi- cation of the classical double-blind placebo controlled clinical trial. In this study, three times as many subjects were assigned to the groups constituting the primary com- parison, than were assigned to the placebo group." Comment: Blind outcome assessment and use of placebo described |
|--|---------|--|
| Incomplete outcome data addressed? All outcomes | Unclear | Quotes: Overall drop out for length of fol- low-up: 43% in 3 years. Drop out by group: 568/1328 FD, 184/438 PL. Reasons for losses: Changing of residence, poor quality radiographs, exclusion due to absence at fi- nal examination Comment: Numbers lost were not unduly high for the length of follow-up with no differential losses between groups. It is un- clear if reasons for missing outcome data are acceptable and balanced. Caries data used in analysis pertain to participants present at final examination |
| Free of selective reporting? | Yes | Outcomes reported: DMFS increment - (CA)cl+(ER)xr, re- ported at 1, 2 and 3 years follow-ups. DMFT. Comment: Trial protocol not available. All pre-specified outcomes (in Methods) were reported and were reported in the pre-spec- ified way |
| Baseline characteristics balanced? | Yes | Prognostic factors reported: DMFS: 6.06 (6.15) FD1, 5.65 (5.60) FD2, 5.59 (5.02) PL; DMFT: 3.61 (3.31) FD1, 3.49 (3.07) FD2, 3.44 (2.77) PL Comment: Initial caries appears balanced. |
| Free of contamination/co-intervention? | Unclear | Quote: "Toothbrushes and dentifrice la- belled with the subject's name and unique identification number were supplied by the study's sponsor in plain white tubes" Comment: Not enough information pro- vided. |

Characteristics of excluded studies [ordered by study ID]

| Study | Reason for exclusion |
|-----------------|--|
| Andlaw 1983 | Equivalent fluoride concentration (SMFP 1000 ppm F (2 groups). Placebo plus 3% TMP) |
| Baysan 2001 | Inadequate follow-up period (6 months). |
| Beiswanger 1981 | Equivalent fluoride concentration (1000 ppm SnF ₂ , 1100 ppm NaF). |
| Beiswanger 1989 | Equivalent fluoride concentration (1100 ppm NaF, 1100 ppm SMFP) |
| Bibby 1945 | Random allocation not stated or indicated. |
| Biesbrock 2003 | Participants initially randomised to placebo toothpaste switched to either NaF 500 ppm F or NaF 1450 ppm F after 9 months. Inadequate follow-up of 9 months |
| Bixler 1966 | Study participants included children and adults (age range 11 to 23 years) |
| Blinkhorn 1988 | Equivalent fluoride concentration (1400 ppm NaF, 1400 ppm SMFP, 1000 ppm SMFP + 450 ppm NaF) |
| Curnow 2002 | Comparison of children receiving fluoridated toothpaste as part of a supervised toothbrushing programme with children receiving no intervention |
| Cutress 1992 | Post-trial evaluation. Data coding problems in original trial |
| De Paola 1993 | Equivalent fluoride concentration (1000 ppm SMFP, 1000 ppm NaF, 1000 ppm NaF) |
| Dolles 1980 | Additional non-fluoride active agent (chlorhexidine). |
| Downer 1976 | Non-randomised. Additional topical fluoride-based intervention |
| Edlund 1977 | Equivalent fluoride concentration (1000 ppm SMFP, 1000ppm NaF) |
| Ennever 1980 | Random allocation not stated or indicated. |
| Feng 2007 | Inadequate follow-up period (6 months). |
| Finn 1963 | Medically compromised institutionalised children. |
| Frankl 1968 | Additional non-fluoride agent in placebo toothpaste (N-lauroyl sarcosinate). Equivalent fluoride concentration (1000 ppm SnF ₂ , 1000 ppm SMFP). 31% of participants had been in an earlier trial of fluoridated toothpaste |
| Gerdin 1972 | Systematic allocation. |
| Gish 1965 | Additional topical fluoride-based intervention. |
| Hargreaves 1973 | Systematic allocation. |

(Continued)

| Heidmann 1997 | Aluminium-containing test toothpaste. |
|----------------|---|
| Hill 1959 | Random allocation not stated or indicated. |
| Horowitz 1966 | Systematic allocation. |
| Horowitz 1966a | Dentifrice versus aqueous solution. |
| Jordan 1959 | Only 2 clusters (schools), each randomised to 1 of the 2 interventions compared |
| Koch 1967 | Systematic allocation. |
| Koch 1972 | Potassium fluoride and manganese chloride test toothpaste. |
| Koch 1982 | Additional topical fluoride-based intervention. |
| Kunzel 1977 | Additional fluoride-based intervention with fluoride toothpaste |
| Kyes 1961 | Adults. Non-randomised. |
| Lu 1985 | Additional non-fluoride agent in test toothpaste only. |
| Mergele 1968a | Medically compromised institutionalised young adults and children selected |
| Moller 1968 | Additional agent added to fluoride toothpaste. |
| Muhler 1958 | Random allocation not stated. |
| Muhler 1960 | Non-random allocation. |
| Murray 1980 | Random allocation not stated. |
| Onisi 1970 | Random allocation not stated or indicated. |
| Patz 1970 | Significant proportion of participants 17 years or older at commencement of study (average age 16 years 4 months) |
| Peffley 1960 | Random allocation not stated. Inadequate follow-up period (10 months) |
| Petersson 1991 | Additional non-fluoride active agent. |
| Ran 1991 | Placebo gel versus AmF gel or toothpaste (fortnightly application) in addition to usual toothbrushing practice |
| Riethe 1975 | Non-randomised. |
| Ripa 1990 | Equivalent fluoride concentration (1100 ppm NaF, 1000 ppm SMFP) |
| Saporito 2000 | Equivalent fluoride concentration (1100 ppm NaF, 1000 ppm SMFP) |

(Continued)

| Sjorgren 1995 | Additional non-fluoride agent added to dentifrice A. |
|---------------|---|
| Stookey 1975 | Random allocation not stated or indicated. |
| Tavener 2006 | Prevalence and severity of fluorosis. No caries data. |
| Thomas 1970 | Additional agent added to fluoride toothpastes. |
| Triol 1987 | Equivalent fluoride concentration (1000 ppm SMFP, 500 ppm SMFP + 500 ppm NaF) |
| You 2002 | Additional oral health intervention for fluoride group. |

DATA AND ANALYSES

DECLARATIONS OF INTEREST

Helen Worthington has an office located in the University of Manchester's Dental Health Unit which is jointly supported by the University of Manchester and Colgate Palmolive. Helen Worthington does not receive any funding from Colgate Palmolive and does not view this as a conflict of interest. Helen Worthington was involved in the design and analysis of three included trials. She did not undertake the risk of bias assessment or the data extraction for these trials. There are no other known potential conflicts of interest.

SOURCES OF SUPPORT

Internal sources

• School of Dentistry, The University of Manchester, UK.

The University of Manchester pays the salaries of Tanya Walsh, Helen Worthington and Anne-Marie Glenny. The Cochrane Oral Health Group is supported by the Department of Health and the Manchester Academic Health Sciences Centre (MAHSC) and the NIHR Manchester Biomedical Research Centre.

External sources

• Department of Health Cochrane Review Incentive Scheme 2008, UK. Provided GBP 5000 to support this review.

• National Institute for Health Research (NIHR), UK. Funds the editorial base of the Cochrane Oral Health Group.
